Thrust pads

for Grub screws GN 632.1 / GN 632.5

SPECIFICATION

Plastic
Technopolymer (Polyacetal POM)

- temperature resistant up to 80 °C
- black, matt

INFORMATION

Thrust pads GN 631 with ball point grub screw GN 632.1 (see page 914) / GN 632.5 (see page 915) are ideal to transmit clamping forces. They lean to uneven and unparallel surfaces. They are easy to press-on to the ball point of the grub screw by hand.

Mounting example

GN 346

RoHS

Ball joint thrust pads

SPECIFICATION

Steel

- Tensile strength class 5.8
- zinc plated, blue passivated

INFORMATION

Ball joint thrust pads GN 346 are in general used for transfer of clamping forces. They adjust themselves to uneven or non-parallel surfaces and clamp without twisting the clamped parts.
The values were arrived at by a series of tests whereby a limited number of ball joint pads were subjected for a limited time to a vertical static load to the pads.
At the values given in the table a permanent deformation of the ball is almost impossible.
Ball joint thrust pads GN 346 can also be used as levelling feet with a small foot diameter.

TECHNICAL INFORMATION

- Strength values of nuts (see page A20)

GN 709.1

Clamping pads

with threaded stud

SPECIFICATION

Types

- Type **B**: Smooth contact face
- Type **R**: Serrated contact face

Steel

- tempered
- phosphated

Ball
Steel

- hardened
- blank

INFORMATION

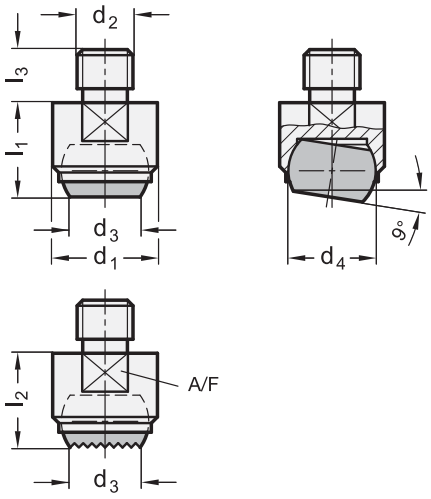
Clamping pads GN 709.1 are used as mobile supports or as spring plungers for clamping workpieces. They can also be used as a back stop.
The ball is limited to an angular movement of 9° only.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

ON REQUEST

- Serrated hard metal ball



Application example when used as a workpiece support

GN 709.8

Clamping pads

adjustable

SPECIFICATION

Types

- Type **B**: Ball steel, smooth contact face
- Type **R**: Ball steel, serrated contact face
- Type **K**: Ball plastic, smooth contact face

Steel

- tempered
- Tensile strength class 10.9

Ball

Type B and R:
Steel hardened (54+2 HRC)
Type K:
Plastic (Polyacetal POM)

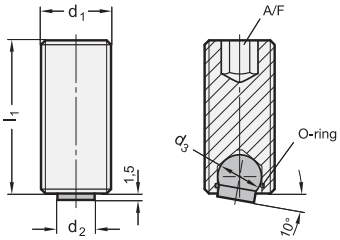
O-Ring
Rubber NBR (Perbunan)

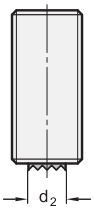
INFORMATION

Clamping pads GN 709.8 are also used in jig and fixture construction, for example for clamping workpieces, as movable bearing surface or as stop. The swivel-mounted ball compensates uneven and non-parallel contact surfaces by as much as 10°. It is also secured against further twisting.
The O-ring holds the ball in position and prevents dirt from penetrating, resulting in a long service life and constant mobility.

TECHNICAL INFORMATION

- Strength values of screws (see page A20)
- Plastic characteristics (see page A2)
- Elastomer characteristics (see page A32)





Application example of different clamping pads with O-ring

Dismountable split set collars

Clamping assembly, technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer.

SCREWS AND NUTS
Two cylindrical head screws with hexagon socket and AISI 316 stainless steel nuts supplied assembled with the two semi-split set collars.

FEATURES AND APPLICATIONS
- Suitable for assembly on idle shafts as end stops, for fixing end limit switches, pulleys, supporting pins or other components.
- They avoid damage to the surfaces of the shaft.
- Lightness and high mechanical resistance.
- Anticorrosive material: possibility of use even in the presence of liquids.
- Resistant to several cleaning cycles with solvents and other chemical agents, for this reason they can be used for applications in the pharmaceutical or food industry.

TECHNICAL DATA
Assembly on h7 ÷ h11 tolerance round shafts.

SPECIAL EXECUTIONS ON REQUEST
Dismountable split set collars with keyway DIN 6885/1 P9 tollerance (see page A16).

Set collars

Steel / Stainless Steel

SPECIFICATION

Types

- Type **A**: Grub screw with slot ISO 7434 (DIN 553)
- Type **E**: Grub screw with internal hexagon DIN 914

Version in Steel
blackened (Standard)

Version in zinc plated
Steel
zinc plated, blue passivated **ZB**

Version in Stainless Steel
AISI 303 **NI**

INFORMATION

Set collars GN 705 essentially comply with the designs of DIN 705 which has been re-issued in April 2007.
The official standard sheet also lists the sizes d_1 = 2 / 2.5 / 3 / 3.5 / 4 / 4.5 / 85 / 90 / 100 / 110 / 120 / 125 / 125 / 140 / 150 / 160 / 180 and 200, although it does not show a whole series of the intermediate sizes listed in the above table.
Also, the official standard sheet still lists the Types B and C for fixing the set collars with transverse pin, but not Type E.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)
- Stainless Steel characteristics (see page A26)

Semi-split set collars

Steel / Stainless Steel / Aluminium

SPECIFICATION

Version in Steel ST

Sintered Steel (Distaloy AB)
black oxidised with vapor

Socket head cap screw DIN 912
Steel, blank

Version in Stainless Steel

Sintered Steel AISI 316 LHC **NI**
Socekt head cap screw DIN 912-A2

Turned version AISI 316 **A4**
weldable
Socket head cap screw DIN 912-A4

Version in Aluminium AL

- ground
- Socket head cap screw DIN 912-A2

INFORMATION

Semi-split set collars GN 706.2 can safely and simply be assembled i.e. with high clamping force without damaging the surface of the shaft.
For size d_1 = 20 to 36 d_3 is a through hole; starting from d_1 = 42 d_3 is a threaded blind bore.
These set collars not only serve as an end stop, but they can also be used for fixing or triggering other components such as end limit switches.

TECHNICAL INFORMATION

- ISO-Fundamental tolerances (see page A21)
- Stainless Steel characteristics (see page A26)

Socket head cap screw DIN 912
Steel, blank

Version in Stainless Steel

Stainless Steel (Sintered Steel) **NI**

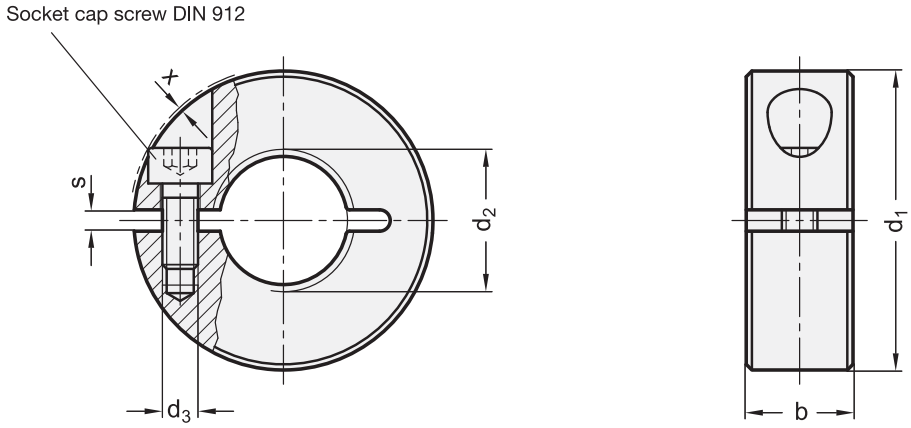
AISI 316L
Socked head cap screw DIN 912
Stainless Steel AISI 304

INFORMATION

Threaded set collars GN 706.3 can be used in connection with bolt thread tolerance 6g. After clamping, the thread of the semi-split set collar may no longer be tolerance-stable (6H).
The thread d_3 for sizes d_1 = 20 to 36 is designed as a through hole, from size d_1 = 42 it is designed as blind hole.

TECHNICAL INFORMATION

- Metric ISO thread (see page A19)
- Stainless Steel characteristics (see page A26)



* Complete with material index of the Threaded set collars (ST or NI)

Screw insert and retaining screw
Stainless Steel AISI 303

INFORMATION

Semi-split set collars GN 706.4 can safely and simply be assembled i.e. with high clamping force without damaging the surface of the shaft.
For size d_1 = 32 and 36, d_3 is a through hole; starting from d_1 = 42 d_3 is a threaded blind bore.
These set collars not only serve as an end stop, but they can also be used for fixing or triggering other components such as end limit switches.

TECHNICAL INFORMATION

Setting screw with internal hexagon
Stainless Steel AISI 303

INFORMATION

Clamping elements GN 826 are normally used in connection with control knobs and smaller handwheels.
Spindles can so be clamped gently and easily and without much construction and installation effort. The clamping wedge stiffens the spindle, e.g., to prevent maladjustments caused by vibrations or to secure the spindle after adjustment.
This clamping element can also be used to store the spindle.
The clamping element may be mounted such that the clamping lever / the clamping screw is positioned either on the left or the right hand side.
Indicator arrows which can be attached to the circumference of the clamping element are found under GN 711.1. (see page 640)

TECHNICAL INFORMATION

GN 704

Quick release set collars

SPECIFICATION

Ring
Aluminium
black anodized

Lever
Aluminium
yellow anodized

INFORMATION

The force lock with the shaft is made in the GN 704 quick release set collars via an eccentric lever which allows the collars to be adjusted easily and quickly without tools. The aluminium design delivers low inertia values.
The specified tightening torque of the screw is a recommended value with which the collar clamped to a shaft (with closed eccentric lever) is capable of reaching the specified axial load capacity. The details on axial load capacity are non-binding guidance values and do not constitute a warranty of characteristics.
Keeping the friction surface of the eccentric lever slightly greased will help to prolong the useful service life.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

not hardened

INFORMATION

Spherical washers DIN 6319 are used for clamping on non-parallel surfaces.
Female washers Type G are mainly used on elongated holes.
When utilizing hexagon nuts with spherical seating DIN 6330 (see page 988) the male washer is redundant.

ON REQUEST (STEEL VERSION)

- Not hardened spherical washers.

INFORMATION

Spherical washers combinations GN 6319.1 provide an "undetachable" connection for male and female spherical washers DIN 6319 (see page 962).
They simply storage and allow fast and efficient installation.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

Spherical levelling washers

Steel / Stainless Steel

SPECIFICATION

Version in Steel
Steel, 1.7225 (42 CrMo 4 V) **ST**
zinc plated, blue passivated

Version in Stainless Steel
Stainless Steel AISI 303 **NI**

INFORMATION

Spherical levelling washers GN 350.3 have been designed to match the levelling sets GN 350 (see page 1014), GN 350.1 (see page 1016), GN 350.2 (see page 1018), GN 350.5 (see page 1020).
The two spherical washers are used together „undetachably".
The load bearing capacity of these spherical washers is relatively high. This is not only due to the material quality but also to the matched sphere of the concave „pan".
Furthermore it is recommended using high-strength washers for bridging d_2.

TECHNICAL INFORMATION

INFORMATION

Washers GN 6341 are used mainly in mechanical machine and jig construction when DIN 125, DIN 9021 and DIN 6340 washers no longer meet requirements.
In particular, Type B for countersunk screws is ideal for solid screw connections with a low construction height.

GN 6339

Heavy duty washers

Low type, High type

SPECIFICATION

Steel, 1.7227 (42 CrMoS 4 V)

tempered to tensile strength
Rm = 1220 ... 1400 N/mm²
fine turned and slide ground

blackened **BT**

GEOMET 500-treated **G0**

INFORMATION

The influence of a washer on the quality of the screwed connection is very often underestimated. With washers GN 6339, high quality preloaded screwed connections can be established.
A high static clamping force can be reached avoiding loss of tension. At a specified preloaded clamping force it is often possible to use thinner bolts. This can result in a better ratio between clamping distance and bolt diameter to minimise the danger of failure.
The case hardened smooth bolt head/screw contact face leads to a lower and more constant friction co-efficient even when continuous clamping and releasing operations are required.
Washers GN 6339 are only suitable for machine construction bolts of classes 8.8 / 10.9 / 12.9, and not for steel bolts DIN 6914.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

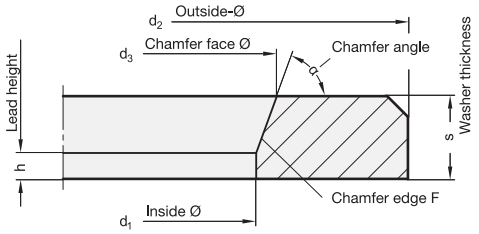
Weight type BT

TECHNICAL INFORMATION



Outside diameter d_2

The outside diameter d_2 of the lower type refers to washers DIN 125 / ISO 7089, and the higher type to washers DIN 7349.

Chamfer face diameter d_3

This dimension is, together with the chamfer angle α 70° and the inside diameter d_1, the most important dimension of these heavy duty washers. Diameter d_3 is actually, even in the lower tolerance range, larger than the max. contact under head diameter on a bolt. This will ensure that the chamfer of d_3 of the hardened washer will not be pressed into the underhead radius causing an indentation on the bolt which would damage the bolt.

Inside diameter d_1

The inside diameter d_1 is kept as small as possible ensuring that the bolt is inserted centrically into the washer. The choice of a matching pair of bolt and washer with least radial clearance is important in order to avoid a mismatch between chamfer diameter d_3 and the max. contact area diameter of the bolt head.

Chamfer angle α = 70° ± 2°

This relatively large angle is necessary when using hexagon headed bolts, which usually have a tapered transfer from shank to head (the so-called trumpet) to avoid fouling of the washer.

Chamfer edge F

The extended chamfer side F as seen from d_3 creates with d_1 an edge the so-called trumpet of the transfer from shank to head of the bolt, so that the smallest radial clearance prevails. Even with the smallest angle of 680 and the lower dimension of d_3 and d_1 the radial clearance of all bolts to DIN EN is still sufficient.

Lead height h

This is the height of the cylindrical part of the internal diameter d_1, h should be as high as possible in relation to the pitch of the thread of the bolt.

Washer thickness s

Washers GN 6339 are higher when compared with DIN washers (exception: DIN 7439 which is equal to the high type).A larger thickness leads to a stronger washer. As a result, bearing in mind the chamfer d_3, a minimum height is established which ensures that the bolt thread will not be damaged when the bolt is tightened.

GN 183

C-Washers

SPECIFICATION

Steel

- Case hardened
- blackened

INFORMATION

C-Washers GN 183 maybe installed without the removal of the nut from the stud.
In terms of dimensions they are almost identical to DIN 6372 C-Washers.

Flat shoulder screw DIN 923
blackened

INFORMATION

Captive C-Washers DIN 6371 transfer the clamping force of screw or nut to the workpiece. After releasing the thread they can be swung away from the clamping point. They are hinged and thus can never be mislaid.
Flat shoulder screws DIN 923 are included.

GN 6342

Washers

Steel / Stainless Steel, with axial friction bearing

SPECIFICATION

Version in Steel
Steel **ST**
blackened

Version in Stainless Steel
Stainless Steel **NI**
AISI 303

Sliding disk

- Plastic (Polyamide 46)
- glasfibre reinforced
- temperature resistant up to 120 °C
- slightly greased (PTFE-mounting grease)

INFORMATION

Used in connection with clamping screws, e. g. star knob screws, washers with axial friction bearing GN 6342 offer the following advantages:
- almost **double** the clamping force owing to lower area friction
- fixed contact surface acting gentrly on the element to be clamped

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Plastic characteristics (see page A2)

Torque amplifier collar

Technopolymer

BEARING CASE MATERIAL

Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

STANDARD EXECUTIONS

- **CMC**: AISI 52100 steel axial bearing, zinc-plated steel washers.
- **CMC-SST**:AISI 440 C stainless steel axial bearing, AISI 303 stainless steel washers.

FEATURES AND APPLICATIONS

Used in combination with clamping levers ERX., ERW., MRX., ERF., clamping knobs type VCT.SOFT or handles type L.652, CMC torque amplifier collars double the clamping force applied at equal torque due to the presence of a bearing acting to reduce friction.

ELESA Original design

DIN 508

T-Nuts

Steel / Stainless Steel

SPECIFICATION

Version in Steel
Heat-treatable Steel

Tensile strength class **8**
blank

Tensile strength class **10**
blackened

Version in Stainless Steel
Stainless Steel AISI 303 / AISI 316Ti **NI**

INFORMATION

Beyond the scope of the official standard sheet DIN 508, there is also a choice of additional sizes a = 16, 20 and 24 and a selection of various thread sizes d.
T-Nuts DIN 508 untapped with the tensile strength class 8 (blank) are also available. When ordering the latter the thread size is omitted in part number.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Strength values of nuts (see page A20)

GN 505

T-Nuts

Accessory for profle systems

SPECIFICATION

Types

- Type **MB**: with increased torque
- Type **OB**: without increased torque

Steel
zinc plated, blue passivated

INFORMATION

T-Slots GN 505 can be inserted vertically into a T-Slot like rhombus T-Nuts GN 508.1 (see page 985).
When tightening the clamping bolt, the nut will be forced into a crosswise position by the applied torque and firmly anchored in the T-slot.
This action is achieved by using T-nut type MB which is intentionally fitted with an overtight fit requiring a higher torque.
To remove the bolt and T-nut a 90° anticlockwise turn is sufficient to withdraw the two components with the clamped workpiece.
The clamping face of the T-nut is serrated to ensure that a possible plating coat in the T-slot is penetrated to establish a good electrical contact.

GN 505.4

T-Slot bolts

Accessory for profile systems

SPECIFICATION

Steel
zinc plated, blue passivated

INFORMATION

T-Slot bolts GN 505.4 can be inserted vertically into the slot. During tightening, the bolt is forced into the crosswise position and thus anchored in the slot. Conversely, the bolt is turned back during loosening and can then be removed.
The clamping face of the bolt is serrated to ensure that the eloxal coating is broken up to establish a good electrical contact.

GN 505.5

Stainless Steel-T-Slot bolts

Accessory for profile systems

SPECIFICATION

Stainless Steel AISI 304

INFORMATION

T-Slot bolts GN 505.5 can be inserted vertically into the slot. During tightening, the bolt is forced into the crosswise position and thus anchored in the slot. Conversely, the bolt is turned back during loosening and can then be removed.
The clamping face of the bolt is serrated to ensure that the eloxal coating is broken up to establish a good electrical contact.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

T-Nuts

Accessory for profile systems, with guide step

SPECIFICATION

Steel
zinc plated, blue passivated

Ball
Stainless Steel

Spring
Stainless Steel

INFORMATION

T-Nuts GN 506 can be turned into position, i.e. they can be inserted at any point along the slot.
The guide step positions the nut parallel and centered in relation to the slot, a configuration which eases the sliding movement and prevents the assembly from twisting during tightening.
The spring element (ball / pressure spring) prevents the nut from accidentally sliding inside the slot, which is particularly advantageous when the profile rail is mounted perpendicularly.

Stainless steel **NI**

Ball
Stainless Steel

Spring
Stainless Steel

INFORMATION

T-Nuts GN 506.1 can be turned into position, i.e. they can be inserted at any point along the slot.
The spring loaded ball will prevent an unwanted movement of the nut in the slot which can easily occur on a bed with the T-slots in a vertical position.
As an example Nuts GN 506.1 can be used to fit hinges to commercially available extrusion rails.

T-Nuts

Accessory for profile systems, with spring steel sheet

SPECIFICATION

Steel
zinc plated, blue passivated

Spring steel sheet
Stainless Steel AISI 301

- spot-welded

INFORMATION

T-Nuts GN 506.2 can be turned into position, i.e. they can be inserted at any point along the slot.
The spring washer prevents the nut from inadvertently being displaced inside the slot, which is particularly advantageous if the profile rail is arranged vertically. The outstanding feature of this design is that different slot heights can be bridged.
As an example, T-Nuts GN 506.2 can be used to fit hinges to commercially available extrusion rails.

GN 508.2

T-Nuts

with slip proof

SPECIFICATION

Heat-treatable Steel

Tensile strength class **8**
zinc plated, blue passivated

Tensile strength class **10**
blackened

INFORMATION

T-nuts GN 508.2 are dimensionally indetical to DIN 508 (see page 977).
They are, however, fitted on the side with a spring loaded ball. This will prevent an unwanted movement of the nut, especially in a vertically mounted T-slot bed.

TECHNICAL INFORMATION

- Strength values of nuts (see page A20)

Hexagon nuts

Steel / Stainless Steel, with spherical seating

SPECIFICATION

Type
- Type **B**: with one-sided spherical seating

Version in Steel
Steel
- Tensile strength class 10
- blackened

Version in Stainless Steel
Stainless Steel AISI 303 **NI**

INFORMATION

Hexagon nuts DIN 6330 are used on clamping, applications which require frequent clamping and unclamping (m = 1.5 x d1).
The spherical seating together with female washers DIN 6319 (see page 962) allows excessive positional inaccuracies to be equalized.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)
- Stainless Steel characteristics (see page A26)
- Strength values of nuts (see page A20)

DIN 6331

Hexagon nuts

with collar

SPECIFICATION

Steel

- Tensile strength class 10
- blackened

INFORMATION

Hexagon nuts DIN 6331 are used on clamping applications which require frequent clamping and unclamping (m = 1.5 x d1).
The collar of the nut eliminates the need for washers.
The official standard sheet specifies the additional sizes M 27, M 42 and M 48. But M 14 is not forseen on the official standard sheet.

ON REQUEST

Size M10 with A/F = 17

TECHNICAL INFORMATION

- Strength values of nuts (see page A20)

Slotted locknuts

Steel / Stainless Steel

SPECIFICATION

Types

- Type **W**: Steel, not hardened
- Type **WNI**: Stainless Steel, not hardened
- Type **H**: Steel, hardened

Type W
Steel

- Tensile strength class 5
- not hardened
- blackened

Type WNI
Stainless Steel AISI 303
- not hardened

Type H
Steel

- Tensile strength class 5
- hardened HRC 60 ± 2 (thread not hardened)
- Mating surface ground or fine turned

INFORMATION

On slotted locknuts DIN 1804 the ground surface d_3 stands proud and should be used as a mating surface.
The sizes M45x1.5 to M60x1.5 have 6 slots.
The official DIN standard sheets specifies additional sizes (up to M 200 x 3).

TECHNICAL INFORMATION

Slotted locknuts

self-locking, with polyamide insert

SPECIFICATION

Steel

- Tensile strength class 5
- zinc plated, blue passivated

INFORMATION

Slotted locknuts GN 1804.1 are self-locking owing to their polymaide insert. They can therefore also be used as a setting nut and may be used more than once.
The thread series coresponds to roller bearing slotted locknuts DIN 981.

TECHNICAL INFORMATION

- Metric ISO fine thread (see page A19)
- Plastic characteristics (see page A2)

ACCESSORY

- C-Spanner DIN 1810 (Code no. see table) (see page 994)

GN 1804.2

Slotted locknuts

with thread locking

SPECIFICATION

Nut
Steel **ST**

- Tensile strength class 5.8
- blackened

Set screw
Steel, blackened

INFORMATION

GN 1804.2 slotted locknuts with thread locking can be secured against twisting by twisting off the threaded shaft via a d_4 set screw. The thread flanks of the nut ensure damage-free securing and can be used as often as needed.
The d_3 offset plane surface is intended as an axial contact surface.

Assembly sets for profile systems 30 / 40

for slot width 6 / 8, assembly with T-Nuts GN 506

SPECIFICATION

Types

- Type **A**: with cylinder head screw DIN 912
- Type **B**: with countersunk screw DIN 7991
- Type **C**: with lens screw ISO 7380
- Type **D**: with cylinder head screw DIN 7984

T-Nuts GN 506 (see page 982)
Steel

- zinc plated, blue passivated
- Ball / Spring Stainless Steel

Cylinder heads screws DIN 912
Countersunk screws DIN 7991
Lens screws ISO 7380
Cylinder head screws DIN 7984

Steel zinc plated, blue passivated

INFORMATION

Assembly sets GN 965 allow different standard element to be attached to the most common profile systems. Each set includes one T-nut GN 506 (see page 982) and one screw.

- Explanation (see page A44)
- Overview to appropriate standards of the assembly sets GN 965 (see page A45)

Angle pieces / Shackles

for profile systems

SPECIFICATION

Types

- Type **F**: Shackle
- Type **L**: Angle

Identification no.

- No. **1** with bore for countersunk screws DIN 7991
- No. **2** with bore without countersunk

Sheet metal

zinc plated, blue passivated **ZB**

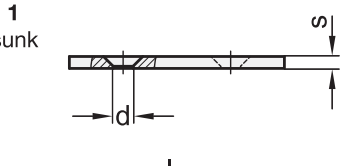
plastic coated
black, RAL 9005, textured finish **SW**
silver, RAL 9006, textured finish **SR**

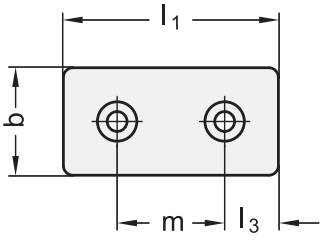
INFORMATION

Angle pieces and shackles GN 967 are preferably used in connection with profile section systems. Square connections or connections with same contact area can so be realised in the smallest of spaces and with a high degree of stability.
Over and above the profile system configurations, the angle pieces and shackles can also be used for a wide variety of different fixing and retaining tasks, for instance in the design of jigs and fixtures.
In the version with identification no. 2 the drill holes are designed without countersunk hole to allow fixing with cylinder head screws, nuts or rivets.

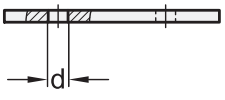
Type **F**

Identification no. **1**
without countersunk

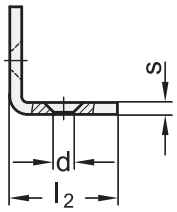


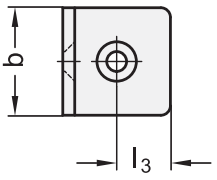


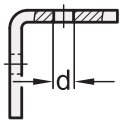
Identification no. **2**
without countersunk



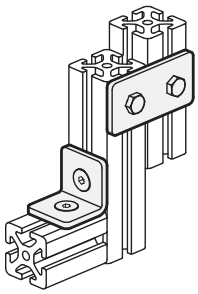
Type **L**

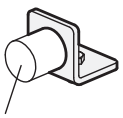






Examples of application





Buffer

Installation brackets

equal / unequal sides

SPECIFICATION

Version with equal sides

Types

- Type **A**: without bores
- Type **B**: with bores

Version with unequal sides

Types

- Type **A**: without bores
- Type **C**: with bores and slotted holes

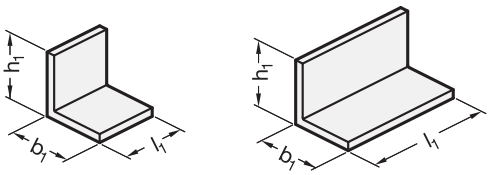
Structural Steel **STB**
drawn, with sharp edges
blackened

Aluminium **ALM**
pressed
matt, ground

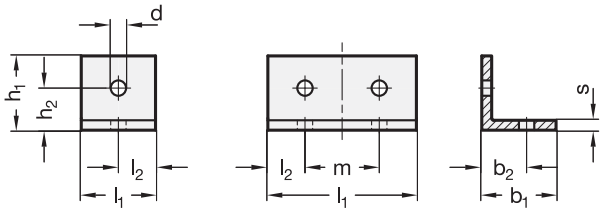
INFORMATION

GN 970 installation brackets are used universally for right-angle connecting and fastening of, e.g. base plates or covers.
Type A allows for the use of drilling templates specific to the application as well as fastening by welding.
Type C installation brackets have one or two combinations of a hole and an elongated hole depending on the length l1.

Type **A**



Type **B**



* Complete with material index of the Installation brackets

DIN 172

Guide bushings

Drill bushings, with collar

SPECIFICATION

Type

- Type **A**: bore one-sided

Steel
hardened (HRC 62 ±2)

Fit sizes d_1, d_2 ground

INFORMATION

The dimensions listed in this standard sheet are merely a selection of the (currently withdrawn) DIN standards.
For applications involving positioning, we recommend the combination with the GN 771.1 guide pins (see page 1011).
For mounting bushings with tolerance n6, a hole with tolerance H7 corresponding to the external diameter is usually provided.

ON REQUEST

- other bores d_1

Guide bushings

Drill bushings, without collar

SPECIFICATION

Type

- Type **A**: bore one-sided

Steel
hardened (HRC 62 ±2)

Fit sizes d_1, d_2 ground

INFORMATION

The dimensions listed in this standard sheet are merely a selection of the (currently withdrawn) DIN standards.
For applications involving positioning, we recommend the combination with the GN 771.1 (see page 1011) guide pins.
For mounting bushings with tolerance n6, a hole with tolerance H7 corresponding to the external diameter is usually provided.

ON REQUEST

- other bores d_1

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

GN 172.1

Guide bushings

with collar / with conical bore, for indexing plungers GN 817.5

SPECIFICATION

Steel
hardened (HRC 60 ±2)

INFORMATION

Guide bushings GN 172.1 with conical bore will be used for the latch bore of indexing plungers GN 817.5 (see page 796).

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

GN 771.1

Guide pins

SPECIFICATION

Steel

- hardened (HRC 60 ±2)
- Fit sizes d p6 / d h6 ground

INFORMATION

Guide pins GN 771.1 are normally used in combination with DIN 172 (see page 1006) / DIN 179 (see page 1008) guide bushings. The shaft tolerance p6 guarantees a perfect pressfit in a mounting borehole H7. The spigot l3 makes the installation easier.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

Threaded flanges

for profile systems

SPECIFICATION

Steel fine casting

- zinc plated, blue passivated **ZB**
- zinc plated and plastic coated black, RAL 9005, textured finish **SW**

INFORMATION

Threaded flanges GN 3490 are used in connection with T-slot profile systems and allow elements to be assembled on or underneath the profiles, e.g. levelling feet.
Depending on the threaded flange, thread size and thread depth dimensions that are available can exceed the dimensions of the profile groove.

GN 6322

Workholding bolts

with ball-type shoulder

SPECIFICATION

Types

- Type **B**: Workholding bolt cylindrical
- Type **C**: Workholding bolt flattened

Steel
hardened

INFORMATION

Workholding bolts GN 6322 are used for positioning in bores, with the ball-type shoulder facilitating the insertion into the bore.
The flattened design (Form C) helps to compensate tolerances in the spacing of two bores. Another application of this design is to fix parts to be positioned in one direction only.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

Levelling sets

Steel / Stainless Steel, long version

SPECIFICATION

Types

- Type **A**: without lock nut
- Type **AK**: with lock nut

Version in Steel

Steel, 1.7225 (42 CrMo 4V) **ST**
zinc plated, blue passivated

Version in Stainless Steel

Stainless Steel AISI 303
(X 10 CrNiS 18-9) **NI**

F_1: max. total load

F_2: max. load after deduction of the max. preload

- for screws 8.8 μ = 0.125 (Steel version)
- for screws 6.8 μ = 0.14 (Stainless Steel version)

INFORMATION

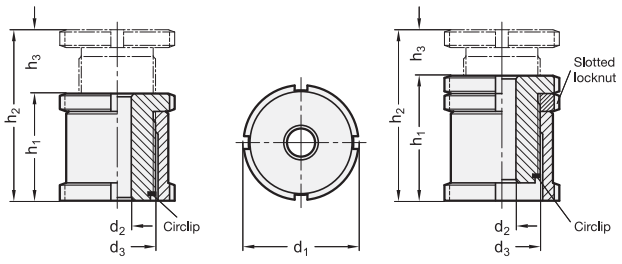
Levelling sets GN 350 are used for levelling and linking operations. They comprise a threaded upper sleeve and a female threaded lower sleeve. The fine thread allows a stepless and precise setting and locking using the C-Spanner DIN 1810 (see page 994). A locking ring serves also as a height limiter for the max. height.
Normally this screw is permanently and securely locked by the static load created when the mounting screw is tightened.
Should this not be sufficient, the use of a locknut (Type AK) is recommended.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

ACCESSORY

- C-Spanner DIN 1810 (code no. see table)



Type **AK** (with locknut)

Type **A** (without locknut) with 2 spherical levelling washers

GN 350.1

Levelling sets

Steel / Stainless Steel, short version

SPECIFICATION

Types

- Type **A**: without lock nut
- Type **AK**: with lock nut

Version in Steel
Steel, 1.7225 (42 CrMo 4V) **ST**
zinc plated, blue passivated

Version in Stainless Steel
Stainless Steel AISI 303 **NI**
(X 10 CrNiS 18-9)

F_1: max. total load

F_2: max. load after deduction of the max. preload

- for screws 8.8 μ = 0.125 (Steel version)
- for screws 6.8 μ = 0.14 (Stainless Steel version)

INFORMATION

Levelling sets GN 350.1 are used for levelling, adjusting and linking operations if small dimensions are given.
They comprise a threaded upper sleeve and a female threaded lower sleeve. The fine thread allows a stepless and precise setting and locking using the C-Spanner DIN 1810 (see page 994). A locking ring serves also as a height limiter for the max. height.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

ACCESSORY

- C-Spanner DIN 1810 (code no. see table)

Levelling sets

Steel / Stainless Steel, with spherical washer, without locknut

SPECIFICATION

Version in Steel
Steel, 1.7225 (42 CrMo 4V) **ST**
zinc plated, blue passivated

Version in Stainless Steel
Stainless Steel AISI 303 **NI**
(X 10 CrNiS 18-9)

F_1: max. total load

F_2: max. load after deduction of the max. preload

- for screws 8.8 μ = 0.125 (Steel version)
- for screws 6.8 μ = 0.14 (Stainless Steel version)

INFORMATION

Levelling sets GN 350.2 are used for levelling, adjusting and linking operations. The spherical washer allows precise installation of two non parallel planes at a required gradient up to ≈ 4°.
They comprise a threaded upper sleeve and a female threaded lower sleeve. The fine thread allows a stepless and precise setting and locking using the C-Spanner DIN 1810 (see page 994). A locking ring serves also as a height limiter for the max. height.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

ACCESSORY

- C-Spanner DIN 1810 (code no. see table)

Weight type B

DIN 6320

Feet

SPECIFICATION

Steel (German Material No. 1.0718)

- not hardened
- blackened

INFORMATION

Feet DIN 6320 are normally used in jig construction if neither a self-aligning support nor an axial adjustment is required.
Unlike the models specified in the official standard sheet, these feet are made of 1.0718 steel (in place of quenched and tempered steel).

DIN 6321

Workholding bolts / Headed dowels

SPECIFICATION

Types

- Type **A**: Headed dowel, low type
- Type **B**: Workholding bolt, high, cylindrical
- Type **C**: Workholding bolt, high, flattened

Steel

- hardened
- blackened

Type A
without centre hole

Type B / Type C
with centre hole

INFORMATION

Workholding bolts DIN 6321 are inserted into bores for positioning, assisted by the flattened design (Form C) to compensate tolerances in the spacing of two bores. Another application of this design is to fix parts to be positioned in one direction only.
Types A and B can also be used as bearing surfaces, stops or as foot.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

Vibration-damping elements

Rubber and steel or stainless steel

BASE
- **DVA**: zinc-plated steel.
- **DVA-SST**: AISI 304 stainless steel.

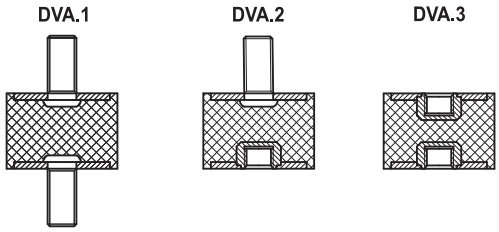
VIBRATION-DAMPING BODY
Natural rubber NR, hardness 40, 55, 70 tolerance ±5 Shore A, black colour.

STANDARD EXECUTIONS
- **DVA.1**: zinc-plated steel threaded studs.
- **DVA.1-SST**: AISI 304 stainless steel threaded studs.
- **DVA.2**: threadead stud and boss in glossy zinc-plated steel, threaded blind hole.
- **DVA.2-SST**: threadead stud and boss in AISI 304 stainless steel, threaded blind hole.
- **DVA.3**: zinc-plated steel bosses, threaded blind holes.
- **DVA.3-SST**: AISI 304 stainless steel bosses, threaded blind holes.

FEATURES AND APPLICATIONS
The vibration-damping elements have been designed to damp vibrations, shocks and noises produced by moving bodies or non-balanced vibrating masses of equipment and machines which can cause:
- malfunctioning and reduction of the machine lifespan and/or of the adjacent ones;
- damage to health;
- noise.

Load diagrams for each single code are available on request.
See technical data and guidelines for the choice on page A53.

SPECIAL EXECUTIONS ON REQUEST
Natural rubber NR, hardness 40, 70 tolerance ±5 Shore A for executions with AISI 304 stainless steel base.



DVA.1 - DVA.2 - DVA.3 | Vibration-damping elements

* Complete the description with the desired hardness:
40, 55 or 70 tolerance ±5 Shore A.

DVA.4 - DVA.5

Vibration-damping elements

Rubber and steel or stainless steel

BASE
- **DVA**: zinc-plated steel.
- **DVA-SST**: AISI 304 stainless steel.

VIBRATION-DAMPING BODY
Natural rubber NR, hardness 40, 55, 70 tolerance ±5 Shore A, black colour.

STANDARD EXECUTIONS
- **DVA.4**: zinc-plated steel threaded stud.
- **DVA.4-SST**: AISI 304 stainless steel threaded stud.
- **DVA.5**: zinc-plated steel boss, threaded blind hole.
- **DVA.5-SST**: AISI 304 stainless steel boss, threaded blind hole.

FEATURES AND APPLICATION
The vibration-damping elements have been designed to damp vibrations, shocks and noises produced by moving bodies or non-balanced vibrating masses of equipment and machines which can cause:
- malfunctioning and reduction of the machine lifespan and/or of the adjacent ones;
- damage to health;
- noise.

Load diagrams for each single code are available on request.
See technical data and guidelines for the choice on page A53.

SPECIAL EXECUTIONS ON REQUEST
Natural rubber NR, hardness 40, 70 tolerance ±5 Shore A for executions with AISI 304 stainless steel base.

Vibration-damping elements

Rubber and steel or stainless steel

BASE
- **DVA**: zinc-plated steel.
- **DVA-SST**: AISI 304 stainless steel.

VIBRATION-DAMPING BODY
Natural rubber NR, hardness 40, 55, 70 tolerance ±5 Shore A, black colour.

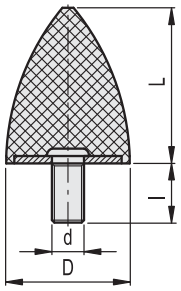
STANDARD EXECUTIONS
- **DVA.6**: zinc-plated steel threaded stud.
- **DVA.6-SST**: AISI 304 stainless steel threaded stud.
- **DVA.7**: zinc-plated steel boss, threaded blind hole.
- **DVA.7-SST**: AISI 304 stainless steel boss, threaded blind hole.

FEATURES AND APPLICATIONS
The vibration-damping elements have been designed to damp vibrations, shocks and noises produced by moving bodies or non-balanced vibrating masses of equipment and machines which can cause:
- malfunctioning and reduction of the machine lifespan and/or of the adjacent ones;
- damage to health;
- noise.

Load diagrams for each single code are available on request.
See technical data and guidelines for the choice on page A53.

SPECIAL EXECUTIONS ON REQUEST
Natural rubber NR, hardness 40, 70 tolerance ±5 Shore A for executions with AISI 304 stainless steel base.

DVA.6
DVA.6-SST



* Complete the description with the desired hardness: 40, 55 or 70 tolerance ±5 Shore A.

Vibration-damping elements

Rubber and steel or stainless steel

VIBRATION-DAMPING BODY

Natural rubber NR, black colour.
Hardness 40, 55, 70 Shore A ±5.

STANDARD EXECUTIONS

- **DVB.6**: zinc-plated steel plate and threaded stud.
- **DVB.6-SST**: AISI 304 stainless steel plate and threaded stud.
- **DVB.7**: zinc-plated steel plate and boss, threaded blind hole.
- **DVB.7-SST**: AISI 304 stainless steel plate and boss, threaded blind hole.

FEATURES AND APPLICATIONS

DVB. vibration-damping elements have been designed to damp vibrations, shocks and noises produced by moving bodies or non-balanced vibrating masses of equipment and machines.
DVB elements are generally used as a bumper or as a limit stop for the absorption of vibrations.
Vibrations can cause:

- malfunctioning and reduction of the machine lifespan and/or of the adjacent ones;
- damage to operator's health;
- noise.

Load diagrams for each single code are available on request.
See technical data and guidelines for the choice on page A53

SPECIAL EXECUTIONS ON REQUEST

Natural rubber NR, hardness 40, 70 Shore A ±5 for the executions with AISI 304 stainless steel base.

DVF.6 - DVF.7

Vibration-damping elements

Silicone rubber and stainless steel

BASE
AISI 304 stainless steel.

VIBRATION-DAMPING BODY
Silicone rubber (MVQ) RAL 7040 grey colour, in compliance with FDA (U.S. Food and Drug Administration), giving the possibility to use in the food and medical industry.
- Hardness 55 Shore A ±5.
- High resistance to ageing.
- Resistance to high temperatures (up to 200°C) and low temperatures (-50°C).

STANDARD EXECUTIONS
- **DVF.6-SST**: AISI 304 stainless steel threaded stud.
- **DVF.7-SST**: AISI 304 stainless steel boss, threaded blind hole.

FEATURES AND APPLICATIONS
DVF.6 and DVF.7 vibration-damping elements have been designed to damp vibrations, shocks and noises produced by moving bodies or non-balanced vibrating masses of equipment and machines.
DVF.6 and DVF.7 elements are generally used as a bumper or as a limit stop for the absorption of vibrations, and for preventing:
- malfunctioning and reduction of the machine lifespan and/or of the adjacent ones;
- noise and thus also damage to health.

Load diagrams for each single code are available on request.
See technical data and guidelines for the choice on page A53

SPECIAL EXECUTIONS ON REQUEST
Silicone rubber (MVQ) in compliance with FDA, hardness 40, 70 Shore A ±5.

DVC.1 - DVC.2 - DVC.3

Vibration-damping elements

Rubber and steel or stainless steel

VIBRATION-DAMPING BODY

Natural rubber NR, black colour.
Hardness 40, 55, 70 Shore A ±5.

STANDARD EXECUTIONS

- **DVC.1**: zinc-plated steel plates and threaded studs.
- **DVC.1-SST**: AISI 304 stainless steel plates and threaded studs.
- **DVC.2**: zinc-plated steel plates, threaded stud and boss, threaded blind hole.
- **DVC.2-SST**:AISI 304 stainless steel plates, threaded stud and boss, threaded blind hole.
- **DVC.3**: zinc-plated steel plates and bosses, threaded blind holes.
- **DVC.3-SST**: AISI 304 stainless steel plates and bosses, threaded blind holes.

FEATURES AND APPLICATIONS

DVC. vibration-damping elements have been designed to damp vibrations, shocks and noises produced by moving bodies or non-balanced vibrating masses of equipment and machines.
Unlike DVA vibration-damping elements, under pressure these articles allow more lateral movement without leaving the vertical plane of the metal insert.
Vibrations can cause:

- malfunctioning and reduction of the machine lifespan and/or of the adjacent ones;
- damage to operator's health;
- noise.

Load diagrams for each single code are available on request.
See technical data and guidelines for the choice on page A53

SPECIAL EXECUTIONS ON REQUEST

Natural rubber NR, hardness 40, 70 Shore A ±5, for executions with AISI 304 stainless steel base.

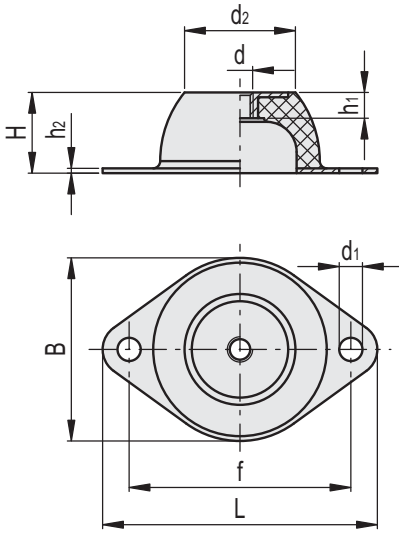
Vibration-damping elements

Rubber and steel or rubber and stainless steel

DVE-A
DVE-SST-A



VIBRATION-DAMPING BODY

Natural rubber NR, black colour.
Hardness 40 and 60 Shore A ±5.

STANDARD EXECUTIONS

- **DVE-A**: zinc-plated steel oval mounting flange, base plate and tapped boss.
- **DVE-SST-A**: AISI 304 stainless steel oval mounting flange, base plate and tapped boss.
- **DVE-B**: zinc-plated steel square mounting flange, base plate and tapped boss.
- **DVE-SST-B**: AISI 304 stainless steel square mounting flange, base plate and tapped boss.

FEATURES AND APPLICATIONS

DVE vibration-damping elements are composed of two metallic elements joined together by a rubber anti-vibration body. A round element with a boss with a threaded pass-through hole constitutes the base for fixing the vibrating machine. Another element, oval or square shaped, constitutes the flange for fastening to the floor.
Generally used for applications with rotary machines that do not present big dynamic imbalances, where elasticity is required both vertically and transversely.
They are therefore very suitable for use with compressors, fans, vibrating feeders, rotary pumps or electric motors.
Vibrations can cause:

- malfunctioning and reduction of the machine lifespan and/or of the adjacent ones;
- noise and thus also damage to human health.

Load diagrams for each single code are available on request.
See technical data and guidelines for the choice on page A53

SPECIAL EXECUTIONS ON REQUEST

- AISI 304 stainless steel elements and NR natural rubber with hardness 40 tolerance ± 5 Shore A.
- Executions with AISI 316 stainless steel mounting flange, base plate and tapped boss.
- Executions with NR natural rubber with different hardness.

Buffers

Retaining washer Stainless Steel

SPECIFICATION

Rubber
Perbunan® (NBR)

- black
- vulcanized to the retaining washer
- temperature resistant up 120 °C
- Hardness Shore A ±5

soft* **40**
medium **55**
hard* **70**

* not available from stock and requires a minium order quanitity.

Retaining washer
Stainless Steel A2

INFORMATION

Buffers GN 454 are used as end-stop buffers, e.g. conveyor trolleys. They can be fixed on the damping side with socket head cap screws DIN 912.
They absorb most of the kinetic energy development on impact. They act as dampers and prevent damaging shock and rebound. They also act as sound dampers.
These buffers are also used as levelling feet.

TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)

GN 919

Hubs with eccentrical cam

SPECIFICATION

Sintered Steel

- case hardened, EHT 0.2 to 0.4 mm
- blank

INFORMATION

Hubs with eccentrical cam GN 919 are used for adjusting and clamping operations. As a rule these are fitted with a gear lever handle GN 310 (see page 566).
The cam offers the advantage that the clamping force remains constant in every position of its travel. In addition the cam is self locking.
Cylinder head shoulder bolts GN 732 (see page 919) can be used as bearing pins.

ACCESSORY

- Gear lever handles GN 310 (are to be ordered seperately) (see page 566)

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

- Screw bolt nitrided, Tensile strength class 8.8

Ball knob DIN 319 (see page 538)
Plastic
Duroplast
black, shiny finish

INFORMATION

Eccentrical cams GN 918 allow the rapid and safe clamping and releasing at a relatively large adjustable range and with high clamping force. The cam not only has the advantage that the clamping effect is of the same magnitude over the whole of the clamping surface (i.e. in every angular position), but also that it is self-arresting in every position.
The ball lever is linked with the eccentric cam via a serrated ratchet, allowing the adjustment of the most suitable clamping position or the "readjustment" of the handle.
Screw bolt and washer (see technical instructions) are matched to ensure that the eccentric cam can be easily turned after tightening. Using a washer requires no special requirements in terms of the threaded hole design. This means it can also be mounted on tables using T grooves.

INFORMATION

Clamping bolts GN 918.1 have a circumferential wedge surface, allowing the rapid and safe clamping and releasing at a relatively large adjustable range and with high clamping force. Owing to the small pitch angle (wedge angle), the clamping bolt is self-arresting.
The ball lever is linked with the clamping bolt via a serrated ratchet, allowing the adjustment of the most suitable clamping position or the „readjustment" of the handle.
Screw bolt and washer (see technical instructions) are matched to ensure that the clamping bolt can be easily turned after tightening. Using a washer requires no special requirements in terms of the threaded hole design. This means it can also be mounted on tables using T grooves.
Clamping bolts have the advantage that they can be turned after releasing in the clamping zone.
The use of GN 605 (see page 928) ball point screws with flattened ball is recommended in connection with the clamping bolts.

RoHS

Clamping bolts

downward axial clamping

SPECIFICATION

Types

- Type **KV**: with ball lever, angular (serration)
- Type **GV**: with ball lever, straight (serration)
- Type **SK**: with hexagon

Clamping direction

- Type **R**: by clockwise rotation (drawn version)
- Type **L**: by anti-clockwise rotation

Steel

- blackened
- Eccentrical cam and washer, case hardened
- Screw bolt nitrided, Tensile strength class 8.8

Ball knob DIN 319 (see page 538)
Plastic
Duroplast
black, shiny finish

INFORMATION

Clamping bolts GN 918.2 have a circumferential wedge surface, allowing the rapid and safe clamping and releasing at a relatively large adjustable range and with high clamping force. Owing to the small pitch angle (wedge angle), the eccentric cam is self-arresting.
The ball lever is linked with the clamping bolt via a serrated ratchet, allowing the adjustment of the most suitable clamping position or the „readjustment" of the handle.
Screw bolt and washer (see technical instructions) are matched to ensure that the clamping bolt can be easily turned after tightening. Using a washer requires no special requirements in terms of the threaded hole design. This means it can also be mounted on tables using T grooves.
Clamping bolts have the advantage that they can be turned after releasing in the clamping zone.
The use of GN 605 (see page 928) ball point screws with flattened ball is recommended in connection with the clamping bolts.

Serrated locking plates

Steel / Stainless Steel

SPECIFICATION

Types

Type **A**: with tapped hole d_3
in the centre, with two countersunk holes
for socket head cap screws

Type **B**: with bore d_4 in the centre,
with two countersunk holes
for socket head cap screws

Type **C**: with tapped hole d_3
in the centre, with two tapped mounting holes

Type **D**: with bore d_4 in the centre,
with two tapped mounting holes

Type **E**: without bores
blank, not hardened

Version in Sintered Steel (Distaloy AB) ST
hardened, black oxidised with vapor

Version in Stainless Steel (Sintered Steel) NI
AISI 316L

INFORMATION

With the aid of serrated locking plates GN 187.4 standard components can be interlocked and firmly set at a defined angle.
The angular position of the fixing bores in relation to the serrations is not defined in the standard design. The exact positioning is available as special design.
The range of designs makes these plates adapt-able for almost any application in this particular field. To complement these serrated locking plates, accessories such as guide pots GN 187.1 (see page 1065) and thrust springs GN 187.2 (see page 1065) are useful additional standard parts.

ACCESSORY

- Guide pots GN 187.1 (see page 1065)
- Thrust springs GN 187.2 (see page 1065)

Toothed clamping elements

SUPER-technopolymer

MATERIAL

Glass-fibre reinforced polyamide based (PA) SUPER-tecnopolymer, black colour, matte finish.

STANDARD EXECUTIONS

Central plain pass-through hole and two holes for pins.

- **RDB-F**: front mounting by means of two holes for cylindrical-head screws.
- **RDB-CF**: with built-in case, front mounting by means of two holes for cylindrical-head screws.
- **RDB-B**: rear mounting by means of two pass-through holes and two stainless steel hexagonal nuts (included in the supply).
- **RDB-CB**: with built-in case, rear mounting by means of two pass-through holes and two stainless steel hexagonal nuts (included in the supply).

FEATURES AND APPLICATIONS

The toothed clamping elements RDB-F and RDB-B, coupled between them or with the executions RDB-CF or RDB-CB, allow to lock the position of two components rotating around an axis.
The locking angle is adjustable with a pitch of 6 °.

ACCESSORIES ON REQUEST

AISI 301 stainless steel push springs facilitating the detachment of the toothed clamping elements.

The maximum torque exercisable (C) is the torque applied to the two fully meshed toothed elements beyond which the material can give rise to some type of failure such as to compromise the functionality of the product. This value will obviously be affected by a coefficient that takes into account the importance and the security level of the specific application.

GN 917

Double cam levers

SPECIFICATION

Steel

- ST 52-3 / German Material No. 1.0570
- blackened

King pin
Stainless Steel AISI 420
tempered

Circlip
Stainless Steel AISI 301

Plastic cover

- red, oil resistant
- temperature resistant up to 60 °C

INFORMATION

Double cam levers GN 917 are used for repositioning and clamping. The eccentrical cam has the advantage that the clamping force remains constant in every position of its travel and in addition is self arresting.
The dimension b_2 is made to match the head size of swing bolts DIN 444 (see page 935) and swing nuts GN 444.2 (see page 936) respectively.

Centring bore clamps

SPECIFICATION

Types

- Type **K**: with clamping balls
- Type **S**: with clamping segments

Steel

- hardened
- blackened

Clamping balls /-segments

- hardened
- blank, ground

INFORMATION

With centring bore clamps GN 411.2 workpieces can be centrally positioned and clamped from the inside of the bore.
They offer the following advantages:
- Precise self centering
- Repetitive accuracy: ± 0.025
- Accuracy of concentricity: ± 0.05
- Solid and stable clamping through either 3 or 6 contact points on the workpiece
- Clamping of workpieces with uneven or irregular surface (such as castings)
- Distortion free clamping
- Reduced height
- Can be fitted in any position
- Large adjustable range
- Draw-down clamping

ON REQUEST

- Centring bore clamps GN 411.3, operable from the opposite side respectively for hydraulic or pneumatic operation
- Centring bore clamps with 2 clamping elements for clamping tubes

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

Operating principle

A circular ball cage containing 3 or 6 balls is forced outwards over an accurately guided cone by means of a screw which, through the exerted thrust, will enlarge the outside diameter of the circular ball cage. This in turn will lead to a firm contact between the centring clamp and bore of the workpiece.
Type K (with balls) is used for clamping applications where minute ball marks at the contact points with the workpiece are acceptable.
Type S (with clamping segments) is used in such cases where marks at the clamping points on the workpiece would be acceptable.

Wedge clamps

SPECIFICATION

Types

- Type **GL**: smooth clamping surfaces
- Type **GA**: with 2 fixing threads for attachment jaws
- Type **RF**: ribbed clamping surfaces
- Type **PR**: with prism jaws

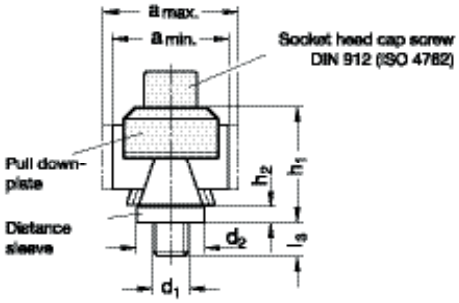
Steel

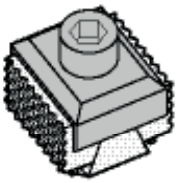
- Wedge surfaces hardened
- blackened

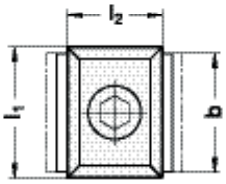
Socket head cap screw DIN 7984
Tensile strength class 10.9 (1000 N/mm²)

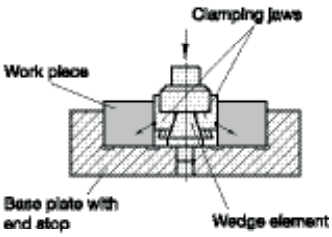
INFORMATION

Clamping with the wedge clamps GN 920.1 is achieved via the socket head cap screw and the clamp wedge which cause both clamping jaws to move outward.
When loosening the screw, the clamp wedge is returned via an **internal** return spring which, in turn, loosens the tension.
Wedge clamps are ideal for multiple clamping operations, but they are also suitable for clamping individual workpieces.
The long hole in the clamp wedge serves to compensate tolerances in the workpiece.

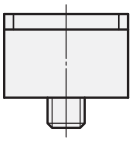


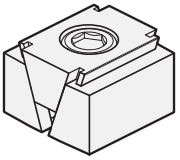




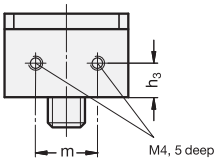


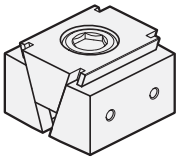
Type **GL** smooth clamping surfaces (jaw blank for workpiece-specific clamping contours)





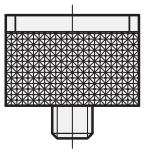
Type **GA** with 2 fixing threads for attachment jaws

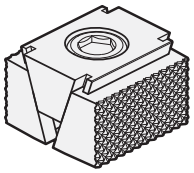




GN 920.1 | Wedge clamps

Type **RF** ribbed clamping surfaces





Type **PR** with prism jaws

GN 928

Shaft clamping units "trueround"

SPECIFICATION

Steel
blackened

Socket head cap screw DIN 912
zinc plated, blue passivated

INFORMATION

With the shaft clamping unit "trueround" GN 928, round workpieces from 6 to 125 mm can be rapidly, accurately and economically clamped.
The threaded hole d_5 can be used for attaching a jig or fixture or a fixing screw for holding the clamping unit in an axial position during an assembly operation.

ACCESSORY

- Mounting tools GN 928.1 (Code no. see table)

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

Cam point screws

SPECIFICATION

Type

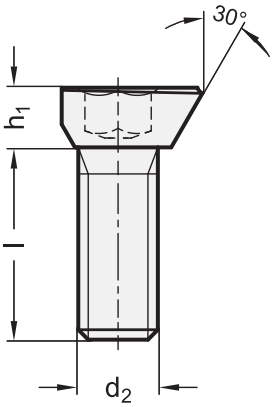
Type **R**: Clamping by clockwise rotation
(d_2 = right-hand thread)

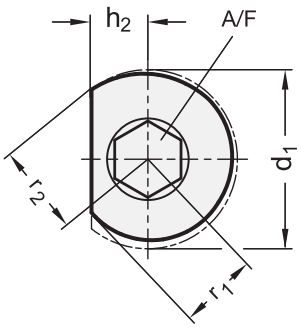
Steel

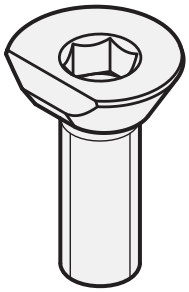
- case hardened HRC 56 ±1
- Tensile strength class 8.8
- zinc plated, blue passivated

INFORMATION

Cam point screws GN 418.2 are sturdy and compact elements, requiring a minimum of installation space and offering ultimate convenience and ease in handling.
The clamping forces F given in the table refer to the maximum permitted tightening torque and the specified screw-in depth t.







GN 418.2

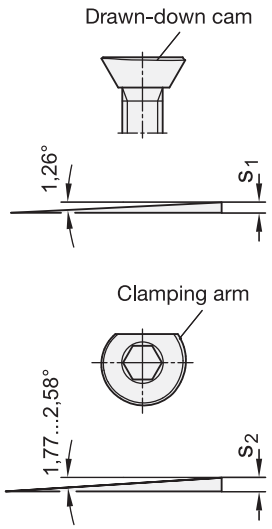
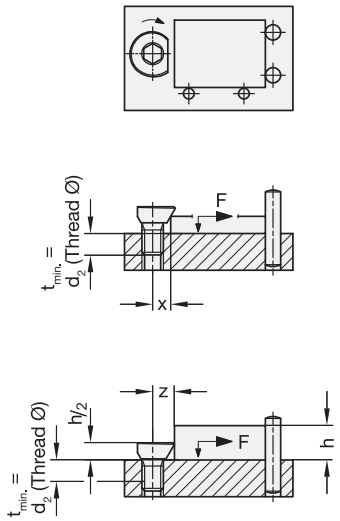
TECHNICAL INFORMATION



Function

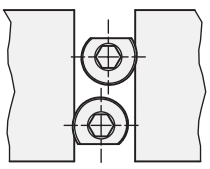
The head of the cam point screw has two cams: a radial clamping cam (with additional 30° taper) and an axial draw-down cam. The cam ensures that the clamping force is the same in any angular position. The cam is also self-locking.
Force components act on the clamping point which generate a draw-down effect and which, in addition to the friction, cause the workpiece to be pressed against a fixed stop. An additional draw-down effect is created by the thread and the 30° taper.
To ensure safe and secure clamping in every application, a right-hand version (with right-hand thread) and a left-hand version (with left-hand thread) is available.



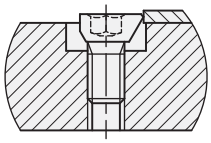
Assembly instructions

- Position the thread bore(s) as specified
- Screw the cam point screw in to the desired height and place it with its flat side facing the workpiece (note the minimum screw-in depth t)
- For clamping effect above the head taper, the minimum clamping height should be h_2
- A turn of approx. 135° is required for clamping

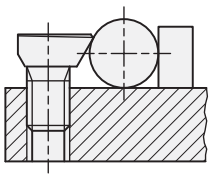
APPLICATION EXAMPLES



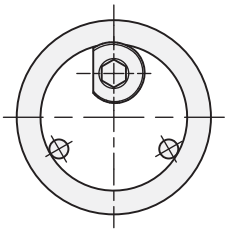
Multiple clamps in the narrowest of space



Clamping flat workpieces (sheet metal)



Clamping round workpieces



Centric clamping in a bore hole

Lifting eye bolts

Steel / Stainless Steel

SPECIFICATION

Version in Steel ST

- Steel C 15 E
- drop-forged
- annealed
- contact face machined
- zinc plated, blue passivated

Version in Stainless Steel A2 NI

- drop-forged
- contact face machined

Version in Stainless Steel A4

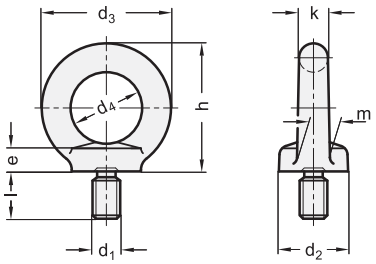
- drop-forged
- contact face machined

INFORMATION

The following guidelines for lifting eye bolts DIN 580 have to be observed in addition to the load values given in the above table:
The eye bolt must be of fully screwed in to achieve a perfect contact between the two mating faces.
Both threads must be of a equal length and the base material of equal strength to that of the bolt.
Operating instructions with more details and specifications are included with every delivery.
The official DIN standard sheet specifies the additional sizes M42, M48, M56, M64, M72 x 6, M80 x 6 and M100 x 6.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)



Axial load-bearing capacity per eye nut

Load-bearing capacity at max. 45° per eye nut

Lateral load-bearing capacity at max. 45° per eye nut

Do not use under shear tension

DIN 582

Lifting eye nuts

Steel / Stainless Steel

SPECIFICATION

Version in Steel ST

- Steel C 15 E
- drop-forged
- annealed
- contact face machined
- zinc plated, blue passivated

Version in Stainless Steel A2 NI

- drop-forged
- contact face machined

Version in Stainless Steel A4

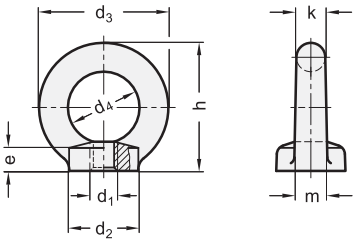
- drop-forged
- contact face machined

INFORMATION

The following guidelines of the lifting eye nuts DIN 582 have to be observed in addition to the load values given in the above table:
The eye nut must be of fully screwd in to achieve a perfect contact between the two mating faces.
Both threads must be of a equal length and the base material of equal strength to that of the nut.
Operating instructions with more details and specifications are included with every delivery.
The official DIN standard sheet specifies the additional sizes M42, M48, M56, M64, M72 x 6, M80 x 6 and M100 x 6.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)



Axial load-bearing capacity per eye nut

Load-bearing capacity at max. 45° per eye nut

Lateral load-bearing capacity at max. 45° per eye nut

Do not use under shear tension

Lifting eye bolts (rotating)

SPECIFICATION

Types

- Type **A**: without spanner
- Type **B**: with spanner

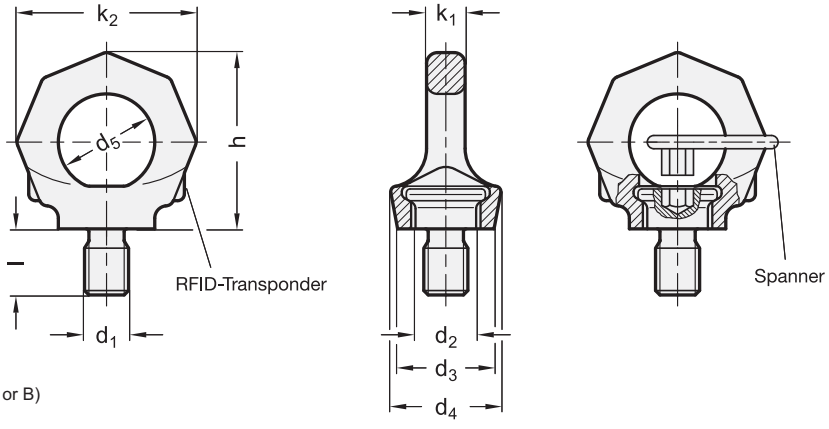
Ring
Steel, German Material No. 1.6541

- forged
- high-tensile tempered
- 100 % electro magnetic tensile tested to EN 1677
- plastic coated, pink

Bolt
Steel
Tensile strength class 10.9
100 % electro magnetic tensile tested

INFORMATION

The lifting eye bolts GN 581 are mounted in rotating bearings, allowing the direction of the force action to be adjusted and preventing inadvertent loosening or overturning (as potentially possible in lifting eye bolts DIN 580, see page 1076).
Lifting eye bolts GN 581 offer a high load carrying capacity and they are tested to meet safety standards (safety factor 4).
The rated load carrying capacity listed in the above table is clearly marked on the ring. It applies to the most unfavourable load application of the load types listed opposite.
Lifting eye bolts GN 581 comply with Mechanical Engineering Directive 2006 / 42 / EG and are BG tested.
The integrated RFID transponder clearly marks and identifies the sling and lifting gear, e.g. during the prescribed regular inspection.
The hexagon socket bolt cannot be removed from the ring.
Type B is suitable for assembly without the need to use tools: inserting the spanner in the hexagon socket of the bolt allows the bolt to be turned in and out by hand.



* Complete with type index of the Lifting eye bolts (A or B)

SAFETY INSTRUCTIONS

The loads given in brackets refer to the load capacity of the corresponding lifting eye bolt DIN 580. If such a value is not indicated the use of the lifting eye bolts DIN 580 is not permitted!
The bolt-on surface for the lifting eye bolts GN 581 must be plane and at a right angle to the threaded borehole; the countersinking must be ≤ the nominal diameter of the thread.
Screwed in, the collar of the screw must make firm contact (do not use washers) and the eye bolt must rotate freely by 360°.
Before applying the load, turn the lifting eye bolt in the direction of the force. The lifting eye bolt is not suitable for frequent rotation cycles under load.
The specified load values apply for a minimum screw-in length of 1.5 × nominal thread diameter in steel with a minimum tensile strength of 37 kp/mm^2, at an ambient temperature of – 40° C to + 280° C. Load-bearing capacity under different conditions upon request. Operating instructions with more details and specifications are included with every delivery (see also www.elesa-ganter.com).

SAFETY INSTRUCTIONS

The above load capacity table shows the maximum loads in metric tonnes as factor of the load ring type and at an operating temperature range of –40 °C to +100 °C, with a safety coefficient of 4 taken into account for all values.
The load ring GN 5860 may be used only if it is bolted with the minimum screw-in depth which depends on the material and if the bolt contact surface is plane and fixed at a right angle to the tap hole.
If permanently mounted in place, the swivel eye bolt must rotate freely by 360° and must not rest on edges or other fixture, e.g. crane hooks. The load rings are not suitable for permanent rotary movement under load exposure. Operating instructions with more details and specifications are included with every delivery (see www.elesa-ganter.com).

Load hooks

SPECIFICATION

Hook
Steel, German Material No. 1.6540

- high-tenisle tempered
- 100% electro magnetic tensile tested to EN 1677
- plastic coated, pink

Safety catch
Steel, German Material No. 1.6541

- forged, high-tensile tempered
- 100 % electro magnetic tensile tested

Bearing case
Steel 1.6541

- forged, high-tensile tempered
- 100 % electro magnetic tensile tested
- zinc plated, blue passivated

Threaded stud
Steel, high-tensile tempered
Finish: Delta Tone

RUD

INFORMATION

Load hooks GN 5862 rotate running in ball bearings. The freely rotating hook allows the bolts to hold loads in any allowed tensile direction.
The rated load-bearing capacity is shown clearly on the swivel eye bolt. It is valid for the most unfavourable case in term of the types of load listed opposite. Load rings GN 5862 comply with Mechanical Engineering Directive 2006 / 42 / EG and are BG tested.
The integrated RFID transponder clearly marks and identifies the sling and lifting gear, e.g. during the prescribed regular inspection.

INFORMATION

The load rings GN 586.1 can be folded and rotated into all approved directions, carrying the full load in any tension direction
They offer a high load carrying capacity and they are tested to meet safety standards (safety factor 4).
The rated load carrying capacity listed in the table is clearly marked on the attachment bolt. It applies to the most unfavourable load application of the load types listed opposite.
Load rings GN 586.1 comply with Mechanical Engineering Directive 2006 / 42 / EG and are BG tested.
The integrated RFID transponder clearly marks and identifies the sling and lifting gear, e.g. during the prescribed regular inspection.
This standard replaces the previous load rings GN 586.

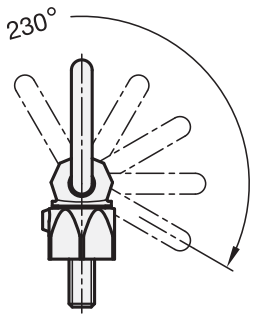
SAFETY INSTRUCTIONS

The above details specify the maximum load in metric tonnes, with the rotating load ring GN 586.1 fixed in place and set in load direction.
The contact surface of the rotating load ring GN 586.1 must be flat and at a right angle to the tapped bore.
When fixed to the member, the attachment bolt must be allowed to rotate freely by 360°. Only the hexagonal bolt supplied with the load ring may be used.
The load ring must move freely and must not be supported by edges.
Before applying the load, both the load ring and the attachment bolt must be turned in load direction, observing the permissible loading depending on the direction of the load ring. Rotating load rings are not suitable for frequent rotations under load.
The specified loading values are valid for a minimum bolt embedment depth of 1,5 × nominal thread diameter in steel with a minimum tensile strength of 37 kp/mm^2 at an operating temperature of between -40 °C and +100 °C. Load capacities under different conditions provided on request. Operating instructions with more details and specifications are included with every delivery (see also www.elesa-ganter.com).



GN 587

Load rings

for welding

SPECIFICATION

Types

- Type **A**: without steel tape
- Type **F**: with steel tape

Ring brackets
Steel, German Material No. 1.6541

- forged
- high-tensile tempered
- 100 % electro magnetic tensile tested to EN 1677
- plastic coated, pink

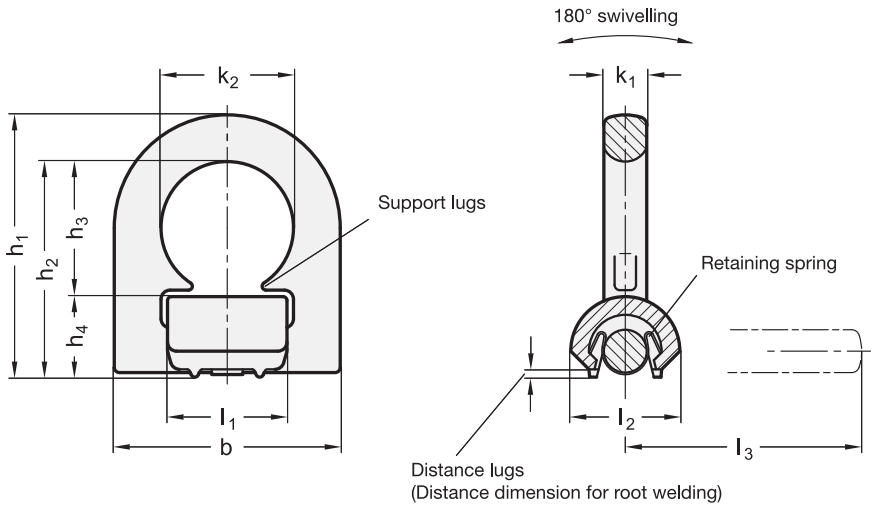
Weld-on block
Steel, S355 J2 + N (ST52-3N)

- forged, blank
- high-tensile tempered
- 100 % electro magnetic tensile tested to EN 1677

Retaining spring
Stainless Steel tape

INFORMATION

Load rings GN 587 for welding are designed for rapid mounting. They provide high dynamic and static strength and can be load from any direction with approved safety (safety factor 4) for all loading directions.
The steel tape (Type F) holds the ring in any position and dampens any noise caused by vibrations. All parts are undetachably connected. The two support lugs improve the bearing of hooks and enhance the support effect in the event of oblique suspension rings.
Load rings GN 587 comply with Mechanical Engineering Directive 2006 / 42 / EG.



* Complete with type index of the Load rings
A without steel tape
B with steel tape

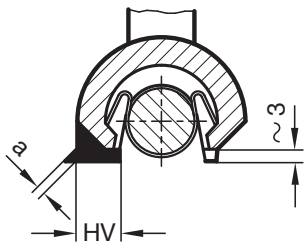
SAFETY INSTRUCTIONS

The above details refer to the maximum load in metric tonnes.
The configurations of the welding seam (HV) complies with the requirements of DIN 18800, i.e. the closed seam means that no corrosive deposits can settle; this also makes the load rings suitable for outside use.



Loading ring size	Size Welding seam	Length	Volume in cm³
b = 66 (1.5 t)	HV 5 + a 3	2 x 33	1.2
b = 77 (2.5 t)	HV 7 + a 3	2 x 40	2.6
b = 87 (4.0 t)	HV 8 + a 3	2 x 46	3.2
b = 115 (6.7 t)	HV 12 + a 4	2x 60	8.7
b = 129 (10.0 t)	HV 16 + a 4	2x 60	15.5

Welding must be made by an approved welder in accordance with EN 287-1.
The specified load values are valid for an operating temperature of between -40 °C and + 100 °C. Load capacities under hicher temperatures provided on request.
If the load rings are used for lashing instead of lifting, the nominal load is doubled.
Operating instructions with more details and specifications are included with every delivery.

GN 589

Lifting points

for welding

SPECIFICATION

Steel, German Material No. 1.6541

- forged
- high-tensile tempered
- 100 % electro magnetic tensile tested to EN 1677
- phosphated

INFORMATION

Lifting points GN 589 are distinguished for their very low dimensions. They provide high dynamic and static strength and can be load from any direction with approved safety (safety factor 4) for all loading directions.
The rated load carrying capacity listed in the above table is clearly marked on the lifting point. It applies to the most unfavourable load application of the load types listed opposite
Lifting points GN 589 comply with Mechanical Engineering Directive 2006 / 42 / EG.

Welding must be made by an approved welder in accordance with EN 287-1.
The specified loading values are valid for an operating temperature of between -40 °C and +200 °C. Load capacities under higher temperatures provided on request.
Operating instructions with more details and specifications are included with every delivery (see also www.elesa-ganter.com)

GN 584

Shackles

straight version

SPECIFICATION

Types

- Type **A**: with stud bolt
- Type **B**: Bolt with nut and split pin

Ring bracket

- Heat-treatable steel, die-forged
- hot-dip galvanised

Bolt

- Heat-treatable steel, die-forged
- galvanic zinc plated, lacquered

INFORMATION

High-strength, straight shackles GN 584 are made in analogy with the US Federal Specification RR-C-271 and feature sixfold safety standards, which means that the minimum failure load is at least six times greater than the value of the nominal load (WLL).
The rated size and the nominal load (WLL) are drop-forged into the shackle which makes it easier to select the proper sling gear. In general, the nominal load must not be exceeded.
The designs with nut and split pin (Type B) are normally recommended for permanent connections. The bolts are allowed to rotate, and the nuts are secured against inadvertent loosening with a split pin.
Operating instructions with more details and specifications are included with every delivery.

- heat-treated, manganese phosphated

Version in Stainless Steel
Stainless Steel **NI**
Stud AISI 630
age-hardened

Shackle AISI 316Ti

Push button
Aluminium, red anodized

Spring
Stainless Steel

INFORMATION

Lifting pins GN 1130 are carrier elements designed for fast and easy use. Pressing the red aluminium button will release the locking effect of the locking ball, allowing the load bolt to be moved in or out of the holding bore hole. The shackle rotates by at least 180°, with a safety flange fitted as a safeguard against inadvertent operation. Depending on the direction of pull, the ball load bolt may move freely by 360° in the holding bore hole.
Sling and lifting gear permanently remaining at the workpiece (e.g. load rings) is no longer necessary. Holding bore holes with d_1 H11 are sufficient in use with corresponding strength of materials.
Furthermore, the GN 1132 (see page 1098) holding bushings are also available.
For more user guidlines, see the operating instruction enclosed with every lifting pin.

Holding bushings

for lifting pins GN 1130

SPECIFICATION

Type

- Type **A**: with external hexagon

Bushing
Stainless Steel

- AISI 630
- precipitation hardened

INFORMATION

Holding bushings GN 1132 are used in connection with lifting pins GN 1130 (see page 1096).
The length l_1 of the holding bushing should be equal to length l_1 of the lifting pin in order to recht the load specification given in the table for GN 1130 at plug-in length x.
Holding bushingsintended to remain permanently at the workpiece, creating a place-saving alternative to load rings or similar.

TECHNICAL INFORMATION

- Ball Stainless Steel AISI 440C

INFORMATION

Ball transfer units GN 509 are used on conveyer tracks. They assist a linear or rotary movement of heavy loads on conveyer track.

ACCESSORY

- Spring rings GN 509.3 (Retainers for ball transfer units) (see page 1099)

TECHNICAL INFORMATION

All ball operated conveyers are made up of a number of balls each located in a socket resting on a number of smaller support balls thus allowing the larger ball to rotate in any direction.

Arrangement and choice of ball size

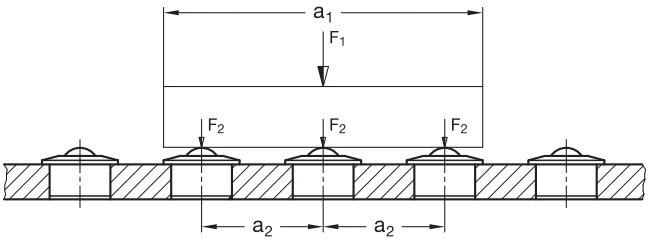
When deciding on the size of the conveyer the following factors have to be taken into account: Weight, size, base material as well as the load to be carried.

The **max. distance between the roller balls „a2“** (on a plane surface) is arrived at by dividing the shortest edge length of the load to be conveyed by 2.5. This ensures that a load will always be supported by carrier balls thus preventing it from tipping over into an empty space.

The required **load carrying capacity** of the balls is determined by the weight of the actual load divided by three. This is arrived at from the assumption that, due to tolerances on the load carrying face and the spacing of the balls in general, only three balls will be under load at any one time.

a_1 = shortest edge length of the load
a_2 = max. distance between roller balls
$a_2 = a_1/2.5$

F_1 = Load weight
F_2 = Load per roller ball
$F_2 = F_1/3$



Speed and friction

The permissible conveying speed is 2 m/sec. With larger roller balls at speeds exceeding 1 m/sec., depending on the weight being conveyed, an increased temperature would be expected.

The **friction values** of the balls at a speed of 1 m/sec. will be in the region of 0.005 µ. This value is, however, dependent on application of usage and could be subject to large variations.

In comparison of balls with sheet metal housings (GN 509) with balls in heavy duty steel housing GN 509.1 (see page 1102), the latter have a higher rigidity. Hence the static values of balls in steel housing can be applied.

Lubrication to prevent corrosion is recommended. The general recommendations applicable to ordinary roller bearings will be sufficient. In most applications lubrication can be ignored.

Resistance to temperature

Balls from size 36 upwards are fitted with a felt seal as protection against ingress of dirt and dust. The latter have a max temperature of 100 °C only.

Balls without the felt seal can also be used at higher operating temperatures. This, however, will lead to a reduced conveying capacity (c). The following table gives indicative values:

125 °C ./. 10 %
150 °C ./. 20 %
170 °C ./. 30 %
200 °C ./. 50 %

The max. operating temperatur for ball transfer units with plastic ball is 60 °C.

Ball transfer units

Heavy duty Steel-housing, without collar

SPECIFICATION

Housing Steel **SBL**

- turned
- zinc plated, blue passivated
- Ball Steel, blank

INFORMATION

Ball transfer untis GN 509.4 are used on conveyer tracks. They assist a linear or rotary movement of heavy loads on conveyer track.
They have no support collar, taking hte load at the housing diameter d_2 instead.

ON REQUEST

- Plastic ball (Polyamide)
- Stainless Steel-Balls
- Stainless Steel-Housings

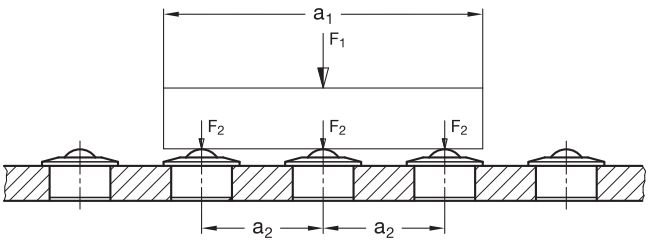
TECHNICAL INFORMATION

All ball operated conveyers are made up of a number of balls each located in a socket resting on a number of smaller support balls thus allowing the larger ball to rotate in any direction.

Arrangement and choice of ball size

When deciding on the size of the conveyer the following factors have to be taken into account: Weight, size, base material as well as the load to be carried.
The **max. distance between the roller balls „a2“** (on a plane surface) is arrived at by dividing the shortest edge length of the load to be conveyed by 2.5. This ensures that a load will always be supported by carrier balls thus preventing it from tipping over into an empty space.
The required **load carrying capacity** of the balls is determined by the weight of the actual load divided by three. This is arrived at from the assumption that, due to tolerances on the load carrying face and the spacing of the balls in general, only three balls will be under load at any one time.

a_1 = shortest edge length of the load F_1 = Load weight
a_2 = max. distance between roller balls F_2 = Load per roller ball
$a_2 = a_1/2.5$ $F_2 = F_1/3$



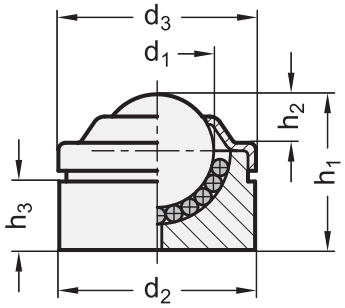
Speed and friction

The permissible conveying speed is 2 m/sec. With larger roller balls at speeds exceeding 1 m/sec., depending on the weight being conveyed, an increased temperature would be expected.
The **friction values** of the balls at a speed of 1 m/sec. will be in the region of 0.005 µ. This value is, however, dependent on application of usage and could be subject to large variations.
In comparison of balls with sheet metal housings (GN 509, see page 1100) with balls in heavy duty steel housing (GN 509.1, see page 1102), the latter have a higher rigidity. Hence the static values of balls in steel housing can be applied.
Lubrication to prevent corrosion is recommended. The general recommendations applicable to ordinary roller bearings will be sufficient. In most applications lubrication can be ignored.

Resistance to temperature

Balls from size 36 upwards are fitted with a felt seal as protection against ingress of dirt and dust. The latter have a max temperature of 100 °C only.
Balls without the felt seal can also be used at higher operating temperatures. This, however, will lead to a reduced conveying capacity (c). The following table gives indicative values:
125 °C ./. 10 %
150 °C ./. 20 %
170 °C ./. 30 %
200 °C ./. 50 %
The max. operating temperatur for ball transfer units with plastic ball is 60 °C.

Version size 8, 12
(Sheet steel cover)



Version size 15, 22, 30, 45

Guide rollers

SPECIFICATION

Types

- Type **ZL**: cylindrical
- Type **KV**: convex
- Type **KF**: wedge-shaped
- Type **KK**: concave
- Type **KR**: circular (O-ring)

Identification no.

- Version **1**: with bore
- Version **2**: with threaded stud

Outer ring
Plastic (Polyacetal POM)
Working temperature: 0° ... 40 °C

Inner ring / balls
Steel, blank

Threaded stud
Steel, zinc plated

O-ring rubber
NBR (Perbunan)

70 Shore A

INFORMATION

Guide rollers GN 753 are suitable for moving or guiding smaller loads. They are commonly used in drive engineering.
With the radial load bearing capacity given in the table, the guide rollers reach a minimum run time of 1 million revolutions. In general, the guide rollers should not be used under axial load.

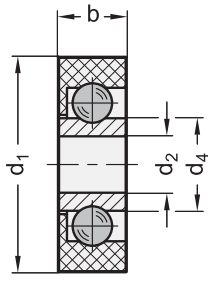
TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)
- Plastic characteristic (see page A2)

ON REQUEST

- Guide rollers with rivet spigot

Identification no. **1**



Identification no. **2**

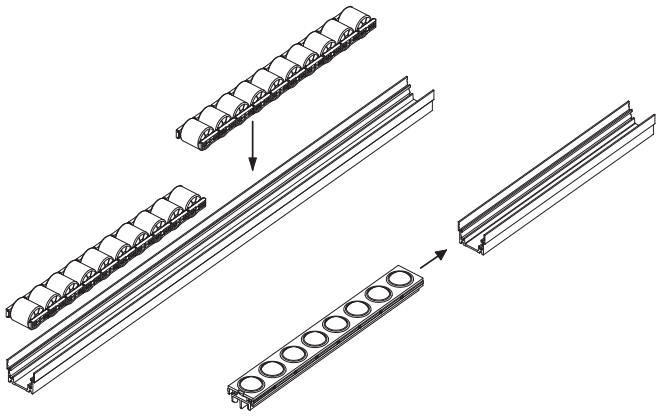
ELEROLL Modular roller tracks

Modular roller tracks for idle handling.
They can be used to create sliding and containing benches suitable for several applications in different fields: feeding and discharging benches in construction machinery, storage and picking systems, packaging machinery, etc.

Modularity

The roller track can be easily assembled by fixing the roller or ball elements inside the appropriate aluminium anodised profiles.
The particular section of the profile allows the snap-in assembly of the roller and ball elements into the profile without the need for screws or other fasteners.

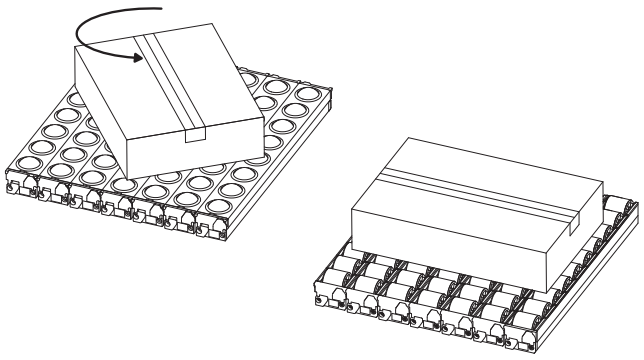


Substitution

The roller and ball elements may be removed and replaced quickly and easily, without disassembling the entire roller track.
The aluminium profile can be reused.

Sliding and quiet operation

The features of the materials of the rollers / balls and relative holders allow friction to be minimises and there is no need for lubrication maintenance.



High load capacity

The roller track ensures a high load capacity, thanks to a maximum capacity for single roller of 360N (PA rollers) and 150N (TPU rollers).

High impact strength

The roller elements are characterised by a high capacity to absorb shocks due to drop of material on the roller track.

Handling of delicate materials

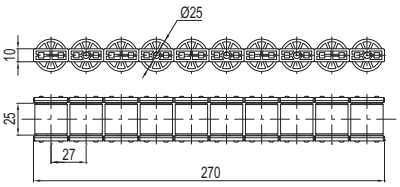
The thermoplastic (TPU) polyurethane rollers, anti-scratch and antitrace material, are also suitable for handling delicate materials such as glass and wood.

Omnidirectional handling

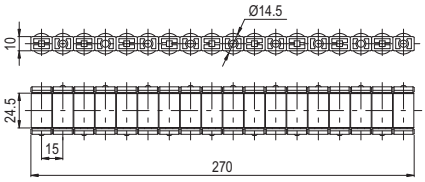
The technopolymer acetal resin based (POM) balls allow the easy handling of the material in any direction.

ELEROLL Modular roller tracks

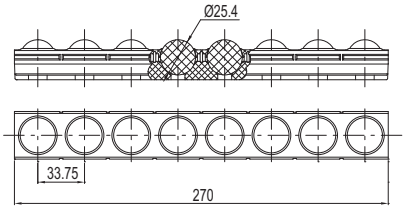
RLT-U
Roller elements
Acetal resin based (POM) technopolymer roller holder, black colour.
RLT-U-PA: polyamide based (PA) technopolymer rollers, black colour.
RLT-U-TPU: thermoplastic (TPU) polyurethane rollers, hardness 92 Shore A, grey colour.



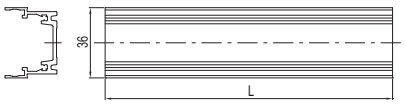
RLT-U15
Roller elements
Rollers: polyamide based (PA) technopolymer, black colour.
Roller holder: acetal resin based (POM) technopolymer, black colour.



RLS-U
Ball elements
Balls: acetal resin based (POM) technopolymer, white colour.
Ball holder: polyamide based (PA) technopolymer, black colour.

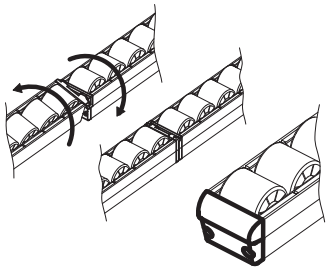


RLT-AL
Aluminium profiles
The profile can hold up to 11 RLT-U roller elements or RLS-U ball elements.
The profile ensures a high resistance to bending under load, and the assembly of the roller tracks without the need for other supports.

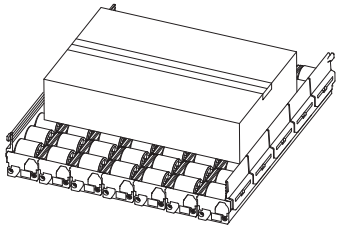


L max 2970 mm

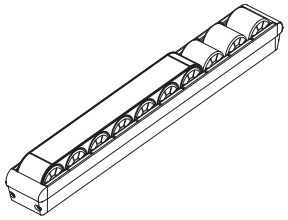
RLT-H
Headers
RLT-HJ header serves to bind tightly two rollers by engaging them. RLT-HE header is the end-element of roller tracks. In addition to being an aesthetic element, the headers represent a safety element for the operator's hands and the handled material.



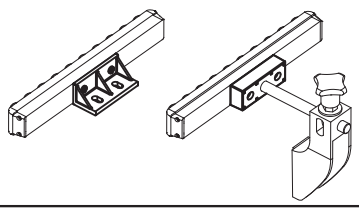
RLT-CE
Containment edge
RLT-CE containment edge is used for the lateral containment of products handled on roller tracks. It is snap-in assembled on RLT-AL aluminum profiles without the need for screws or other fasteners. It can also be mounted to the roller track already fixed.



RLT-B
Brakes
RLT-B brakes allow to slow down and/or stop packages handled on roller tracks. The brakes are snap-in assembled on RLT-U roller elements without the need for screws or other fasteners.



RLT-M
Bracket and support
The bracket and the support facilitate the mounting of roller tracks on machines and other supporting structures.



ELEROLL Modular roller tracks

	Profile	Roller and ball elements	Load capacity #	
			Distributed load, roller fully supported	Concentrated load on a single roller / ball
	RLT-AL	RLT-U-PA RLT-U15-PA	13330 N/m 13330 N/m	360 N 200 N
	RLT-AL	RLT-U-TPU	5550 N/m	150 N
	RLT-AL	RLS-U-POM	850 N/m	30 N

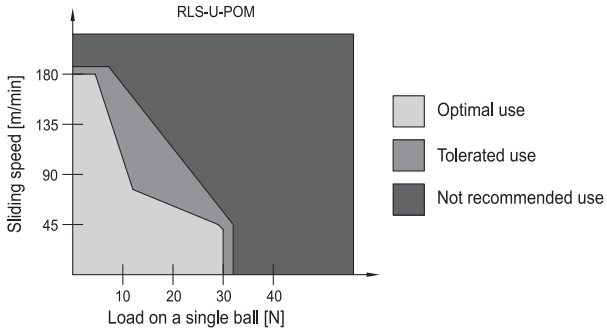
The data in the table refer to the handling of materials with a stiffness such as to keep flat the contact surface with the rollers. Otherwise the values may be lower.

 # RLT-U-PA: load values produce an elastic deformation such as to prevent the regular rotation of the rollers, which come into contact with the ribs of the aluminum profile. At these load values however, no permanent deformation of the material occurs.

 # RLT-U15-PA: the load values exceeding the ones indicated in the table determine a reduction in the rolling resistance. However, no significant permanent deformation of the material occurs to these load values.

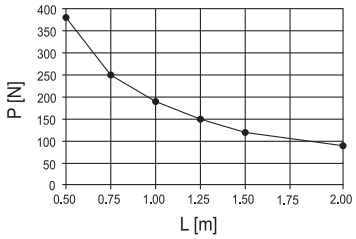
 # RLT-U-TPU: load values higher than those reported in the table produce a deformation such as to prevent the rotation of the rollers, that come into contact with the ribs of the aluminum profile. Loads higher than 100N for a single roller cause a reduction in the rolling resistance.

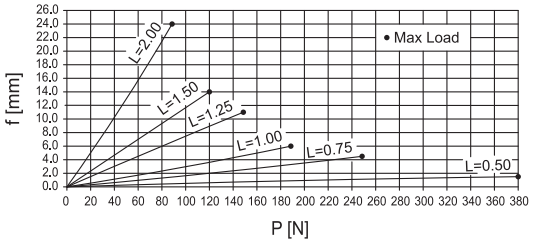
 # RLS-U-POM: load values that limit the smoothness of the balls inside its support, at low sliding speeds. At these load values, however, no permanent deformation of the material occurs. For higher sliding speeds, it is necessary to refer to the chart at the side**.**

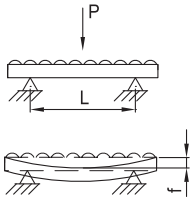


LOAD CAPACITY

LOAD CONCENTRATED IN THE CENTRE, ROLLER TRACK SUPPORTED IN TWO POINTS



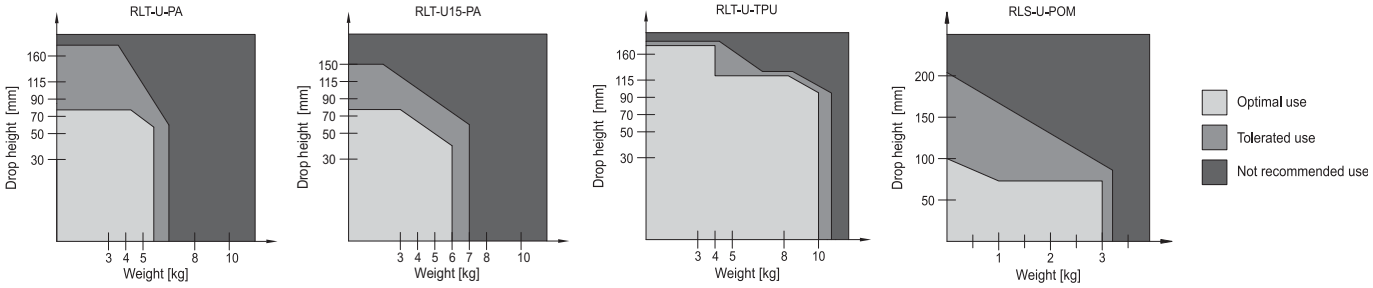




P: applied in the centre of the roller track, the load value generates an elastic deflection of the aluminum profile beyond which the product functionality may be compromised. At this load value, however, no permanent deformation of the material occurs.

L = distance between supports.
f = arrow.

IMPACT STRENGTH



Roller elements for ELEROLL roller tracks

Technopolymer and polyurethane

FMdesign ele:roll®

STANDARD EXECUTIONS

Acetal resin based (POM) technopolymer roller holder, black colour.

- **RLT-U-PA**: polyamide based (PA) technopolymer rollers, black colour. Working temperature +90°/-20°C.
- **RLT-U-TPU**: thermoplastic (TPU) polyurethane rollers, hardness 92 Shore A, grey colour. Working temperature +70°/-20°C.

FEATURES AND APPLICATIONS

- The roller elements, suitably fixed inside the RLT-AL aluminum profiles (Fig. 1) create modular roller tracks for idle handling (both as sliding or containing surfaces), suitable for several applications in different fields: feeding and discharging benches in construction machinery, storage and picking systems, packaging machinery, etc..
- RLT-U-PA roller elements are also suitable for handling heavy packages, RLT-U-TPU roller elements, with rollers in anti-scratch material, allow the handling of delicate materials such as glass and wood.
- The low friction coefficient between the roller and the roller holder eliminates the need for lubrication maintenance.
- The particular section of RLT-AL profile allows the snap-in assembly of the roller elements into the profile without the need for screws or other fasteners (Fig.1). Therefore the roller elements may be quickly and easily removed and replaced, without disassembling the entire roller track.
- The roller elements are divisible in correspondence of predefined sections (Fig.2) so as to create roller tracks of the precise required length.

TECHNICAL DATA

See: ELEROLL Modular roller tracks (on page 1108).

SPECIAL EXECUTIONS ON REQUEST

Rollers in different colour (for example red, yellow, green for the setting up of assembly lines and dynamic warehouses according to Kanban criteria).

Roller elements for ELEROLL roller tracks

For packages with reduced size, technopolymer

ROLLERS
Polyamide based (PA) technopolymer, black colour. Working temperature +90°/-20°C.

ROLLER HOLDER
Acetal resin based (POM) technopolymer, black colour.

FEATURES AND APPLICATIONS
- The roller elements, suitably fixed inside the RLT-AL aluminum profiles (Fig. 1) create modular roller tracks for idle handling (both as sliding or containing surfaces), suitable for several applications in different fields: feeding and discharging benches in construction machinery, storage and picking systems, packaging machinery, etc..
- RLT-U15 roller elements are suitable for handling of packages with reduced weight and size. The smaller diameter of the rollers ensures a reduction in vibrations and consequently a lower noise during handling of packages.
- The low friction coefficient between the roller and the roller holder eliminates the need for lubrication maintenance.
- The particular section of RLT-AL profile allows the snap-in assembly of the roller elements into the profile without the need for screws or other fasteners (Fig.1). Therefore the roller elements may be quickly and easily removed and replaced, without disassembling the entire roller track.
- The roller elements are divisible in correspondence of predefined sections (Fig.2) so as to create roller tracks of the precise required length.
- All the accessories of ELEROLL series can also be used with the RLT-U15 roller elements, except for RLT-B brakes.

TECHNICAL DATA

RLS-U

Ball elements for ELEROLL roller tracks

Technopolymer

BALLS
Acetal resin based (POM) technopolymer, white colour.

BALL HOLDER
Polyamide based (PA) technopolymer, black colour.

FEATURES AND APPLICATIONS
- The ball elements, suitably fixed within the RLT-AL aluminum profiles (Fig. 1) create modular roller tracks for idle omnidirectional handling.
- The ball elements can be combined with RLT-U roller elements for various applications in different fields: feeding and discharging benches in construction machinery, storage and picking systems, packaging machinery, etc.
- The low friction coefficient between the ball and the ball holder eliminates the need for lubrication maintenance.
- The particular section of RLT-AL profile allows the snap-in assembly of the ball elements into the profile without the need for screws or other fasteners (Fig.1).
- The ball elements are divisible in correspondence of predefined sections (Fig.2) so as to create roller tracks of the precise required length.
- The balls may be removed and replaced without disassembling the entire roller track, by using a common screwdriver in the appropriate notch cut into the ball holder (Fig. 3).

TECHNICAL DATA

Profiles for ELEROLL roller tracks

Aluminium

STANDARD EXECUTIONS

- **RLT-AL-AN**: anodised aluminium, natural colour.
- **RLT-AL-BL**: aluminium, natural colour.
- **RLT-AL-AN-SL**: anodised aluminium, natural colour, slotted holes.

FEATURES AND APPLICATIONS

The profile can hold up to 11 RLT-U, RLT-U15 roller elements or RLS-U ball elements. The particular section of the profile allows the interlocking fixing of the roller and ball elements without the need for screws or other fasteners.
The profile ensures a high resistance to bending under load, and the assembly of the roller tracks, even in case of not complete support (Fig. 1), without the need for other supports.

SPECIAL EXECUTIONS ON REQUEST

Profiles with length different from the standard executions (maximum length 2970 mm).

ASSEMBLY INSTRUCTIONS

Fix the profile to the supporting structure with screws of suitable size and number for the specific application, by making, if necessary, appropriate holes in the base of the profile.
The profile can be mounted in two points of support (Fig.1) or in complete support (Fig. 2).
For the drainage of any fluids that can collect inside the profile (for example in case of applications on machines and equipment whose parts must be frequently cleaned by using water jets, for hygienic reasons) it is recommended, if necessary to make holes of appropriate size and shape in the base of the profile.

TECHNICAL DATA

See: ELEROLL Modular roller tracks (on page 1108).

Containment edge for ELEROLL roller tracks

Technopolymer

MATERIAL

Polyamide based (PA) technopolymer, black colour.

FEATURES AND APPLICATIONS

Realized to be used with RLT-U and RLT-U15 roller elements, RLT-CE containment edge needs for the lateral containment of light products handled on ELEROLL roller tracks (Fig.1).
For the containment of medium-heavy materials refer to the RLT-M series (Fig. 3).
The edge is snap-in assembled on RLT-AL aluminum profiles without the need for screws or other fasteners (Fig.2). It can also be mounted to the roller track already fixed.

RLT-B

Brakes for ELEROLL roller tracks

Technopolymer

MATERIAL
Polyamide based (PA) technopolymer, black colour.

STANDARD EXECUTIONS
- **RLT-BR**: brake for RTL-U roller elements.
- **RLT-BRS**: brake for RLT-U roller elements with stop device.

FEATURES AND APPLICATIONS
RLT-B brakes allow to slow down and/or stop packages handled on ELEROLL roller tracks.
The brakes are snap-in assembled on RLT-U roller elements without the need for screws or other fasteners.
RLT-BR brake can be assembled on the upper side of RLT-U-PA and RLT-U-TPU roller elements (Fig. 1) or on the lower side of the RLT-U-TPU roller elements (Fig. 2).

Bracket and support for ELEROLL roller tracks

Technopolymer

MATERIAL
Polyamide based (PA) technopolymer, black colour.

STANDARD EXECUTIONS
- **RLT-MB**: bracket.
- **RLT-MS**: support.
- **RLT-MS-A12**: support with connecting rod and M6 cylindrical head screw with hexagon socket.

FEATURES AND APPLICATIONS
The bracket and the support facilitate the mounting of ELEROLL roller tracks on machines and other supporting structures.

MOUNTING
The bracket and the support are equipped with dowels that are housed in the slots in the lower side of RLT-AL aluminum profiles (Fig. 1) and in special counterseats on the same support for the combination of more supporting elements (Fig. 2).
RLT-MB bracket is compatible with profiles having a slot of 8 mm width (Fig.4).
The bracket and the support allow to mount ELEROLL roller tracks in different configurations. Some examples are shown in Fig.1, Fig.2 and Fig.3.

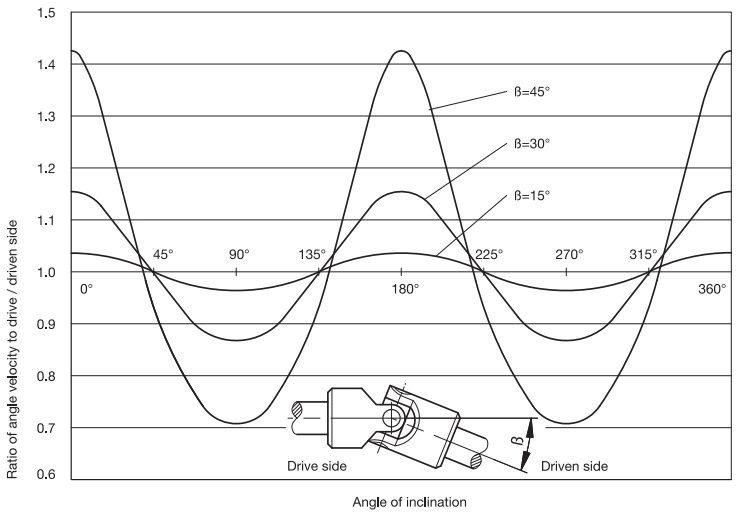
DESIGNED
FOR ENGINEERING

10 Joints

Joints

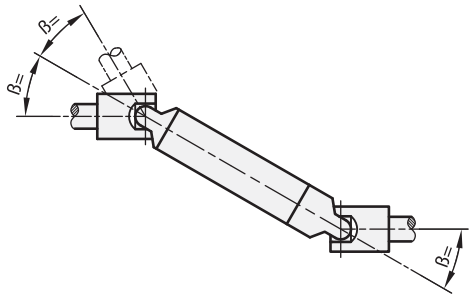
Universal joints and universal joint shafts

Mounting information

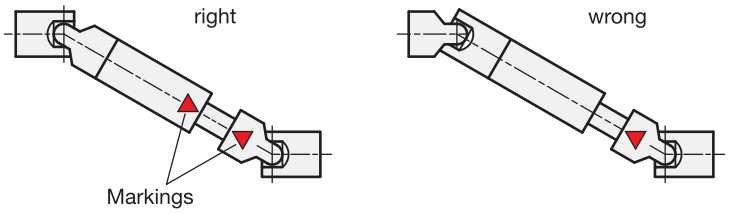


The single universal joints transfer the initial smooth rotation as an irregular rotation. One revolution of the drive shaft via single universal joint will cause the driven shaft to accelerate and decelerate twice. The extent of the irregularity depends on the operating angle ß.

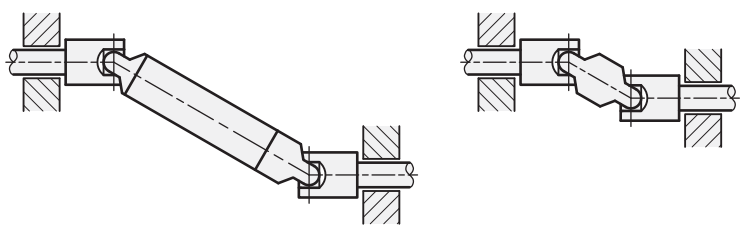
In order to obtain a smooth rotation of the driven shaft two single or one double universal joint is required. In such cases where minor irregularities in the movement are acceptable or where minor operating angles are the norm a single universal joint will do.



For a smooth transfer of a rotating speed, the angle of inclination ß must be equal at both ends of the connecting shaft.



Due to a misconnection of the universal joint shafts, the irregular rotation of each joint is not compensated, but strengthened. This allows joint bearings and wedge profiles to be destroyed. For this reason, the markings of the universal joint shaft halves have to be opposite to each other.

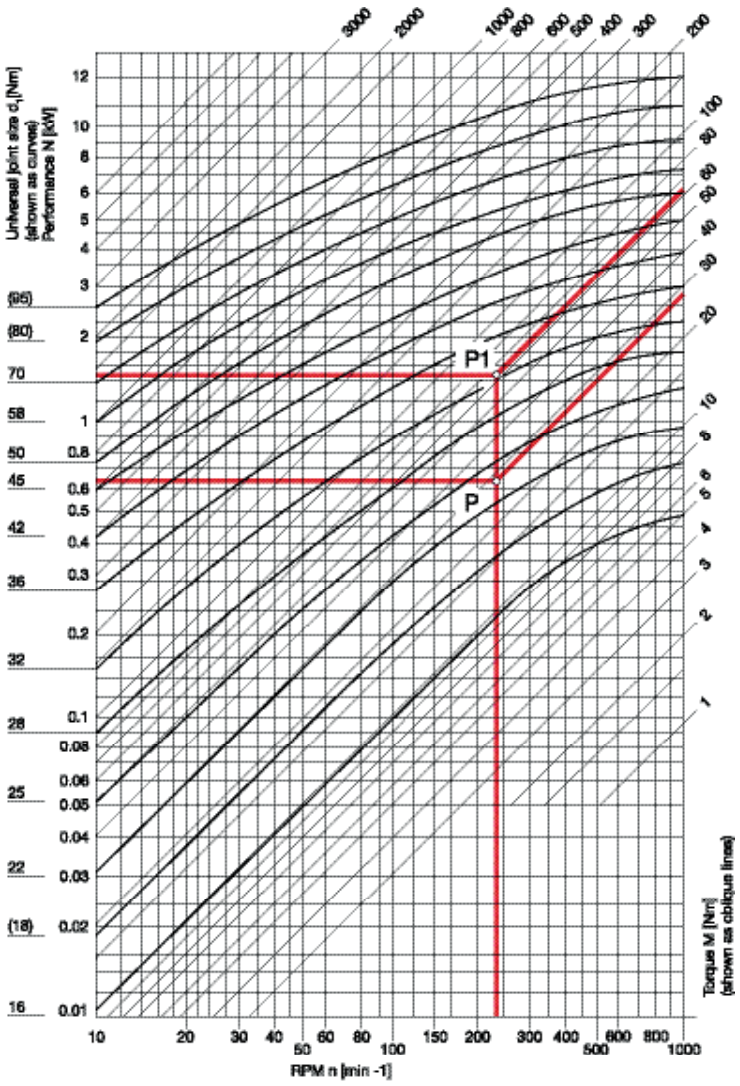


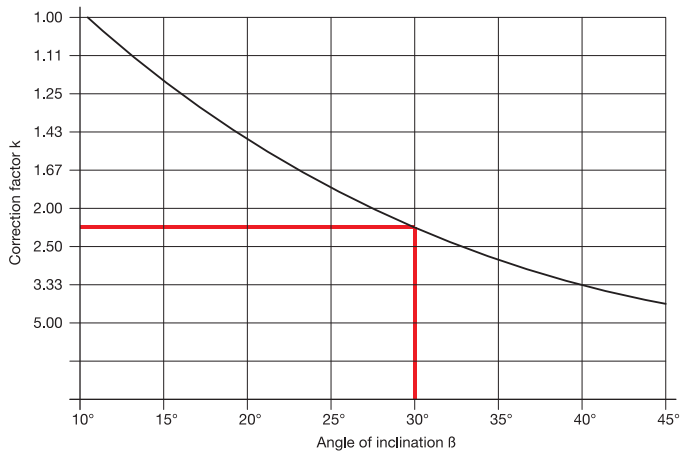
Furthermore the bearings must be as close as possible to the universal joints.

For continuous operation of universal joints with friction bearings adequate lubrication is essential. If drip lubrication is not possible they should be lubricated at least once a day. It is also possible to fit the universal joint with a gaiter GN 808.1 (see page 1131) which can be filled with oil or grease

Universal joints with friction bearing, Type EG

Selection of the size





The table shows the transferable output N and/or torques M of universal joints DIN 808, type EG (single friction bearing) in relation to the r.p.m. n.

The values are only applicable to a constant speed of rotation, constant load and an operating inclination angle of max. 10°. They are not applicable to universal joints in Stainless Steel.

For larger inclination angles ß a nominal output N increased by the correction coefficient k and/or a nominal torque M has to be selected (see example below).

Conversion formulae:

$$\text{Torque M [Nm]} = 9550 \frac{\text{N [kW]}}{\text{n [min}^{-1}\text{]}}$$

$$\text{Output N [kW]} = \frac{\text{M [Nm] x n [min}^{-1}\text{]}}{9550}$$

1 kW = 1.36 PS 1 PS = 0.736 kW

Example 1

Output to be transferred N = 0.65 kW
R.p.m. n = 230 min^{-1}
Angle of inclination ß = 10°

Correction coefficient k = 1
Indicative output N = Nominal output N

Intersection point P is arrived at from 0.65 kW and 230 min^{-1} (which corresponds to a torque of 27 Nm).

The next size up universal joint corresponding to point P is the model with a diameter d1 = 25.

Example 2

Torque to be transferred M = 27 Nm
R.p.m. n = 230 min^{-1}
Angle of inclination ß = 30°

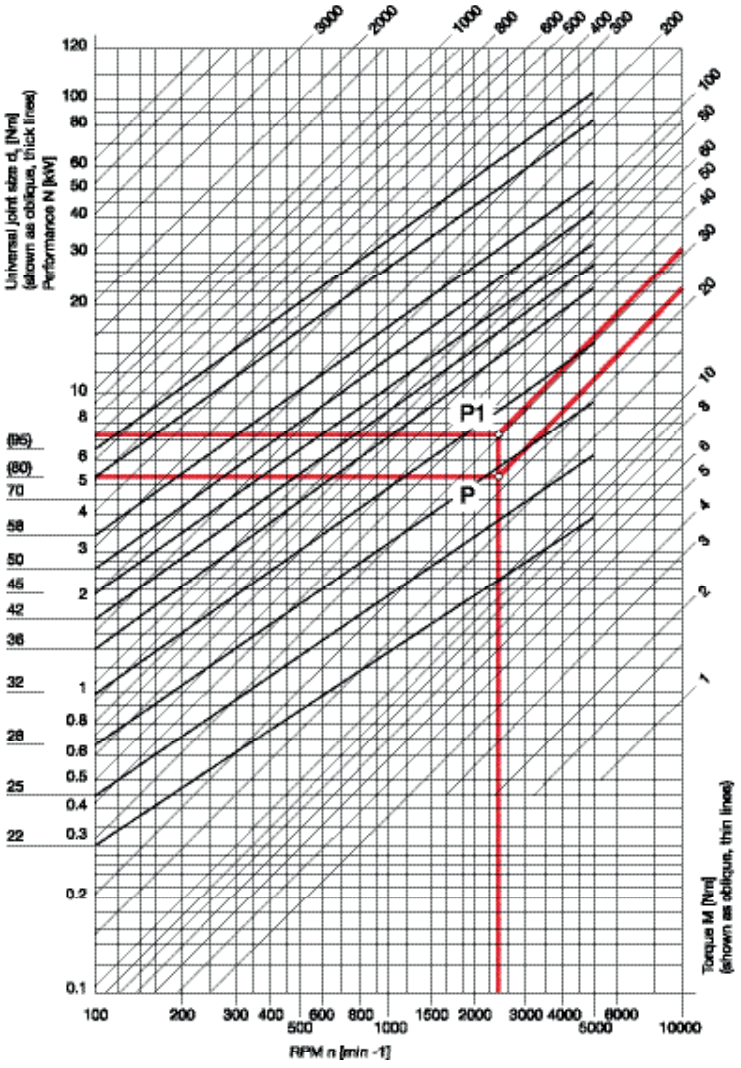
Correction coefficient k = 2.25
Indicative torque = 2.25 x 27 Nm = 60 Nm

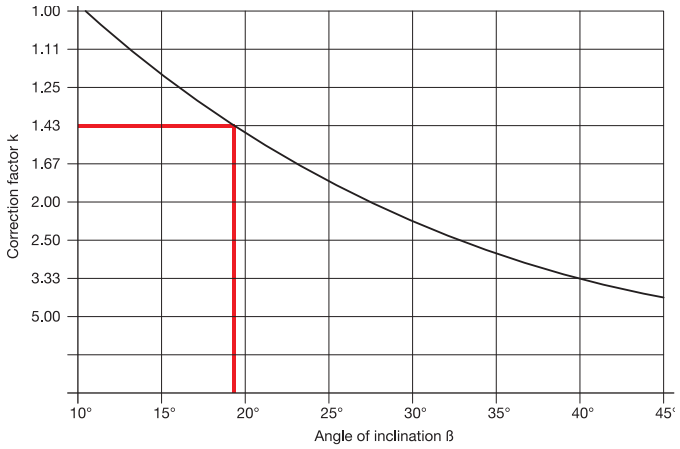
Intersection point P1 is arrived at from 61 Nm and 230 min^{-1} (which is equivalent to an indicative output N = 1.47 kW).

The next size up universal joint corresponding to P1 is the model with a diameter d1 = 36.

Universal joints with needle bearing, Type EW

Selection of the size





The table shows the transferable output N and/or torques M of universal joints DIN 808, type EW (single needle bearing) in relation to the r.p.m. n.

The values are only applicable to a constant speed of rotation, constant load and an operating inclination angle of max. 10°.

For larger inclination angles ß a nominal output N increased by the correction coefficient k and/or a nominal torque M has to be selected (see example below).

Conversion formulae:

$$\text{Torque M [Nm]} = 9550 \frac{\text{N [kW]}}{\text{n [min}^{-1}\text{]}}$$

$$\text{Output N [kW]} = \frac{\text{M [Nm]} \times \text{n [min}^{-1}\text{]}}{9550}$$

1 kW = 1.36 PS 1 PS = 0.736 kW

Example 1

Torque to be transferred N	= 5.5 kW
R.p.m. n	= 2300 min^{-1}
Angle of inclination ß	= 10°

Correction coefficient k = 1
Indicative output N = Nominal output N

Intersection point P is arrived at from 5.5 kW and 2300 min^{-1} (which corresponds to a torque of 23 Nm).

The next size up universal joint corresponding to point P is the model with a diameter d1 = 28.

Example 2

Torque to be transferred M	= 23 Nm
R.p.m. n	= 2300 min^{-1}
Angle of inclination ß	= 18°

Correction coefficient k = 1.43
Indicative torque = 1.43 x 23 Nm = 33 Nm

Intersection point P1 is arrived at from 33 Nm and 2300 min^{-1} (which is equivalent to an indicative output N = 7.9 kW).

The next size up universal joint corresponding to P1 is the model with a diameter d1 = 32.

Universal joints

Steel / Stainless Steel, single or double

SPECIFICATION

Universal joints with friction bearing

Version in Steel

Types

- Type **EG**: single, friction bearing
- Type **DG**: double, friction bearing

Bore codes

- Version **B**: without keyway
- Version **K**: with keyway
- Version **V**: with square

Steel
blank

Joint bearing areas / pins / bearing sleeves
case hardened

Version in Stainless Steel

Types

- Type **EG**: single, friction bearing
- Type **DG**: double, friction bearing

INFORMATION

The permissible r.p.m. of universal joints with friction bearing DIN 808 is to a large extent dependent on the type of application such as load, duration, angular disposition as well as lubrication . For over 1000 r.p.m. universal joints with needle bearing should be used For continuous use ample lubrication is essential. This achieved by fitting the joint with a grease filled gaiter GN 808.1 (see page 1131).

ON REQUEST

- with other or unequal bores

TECHNICAL INFORMATION

- Permissible r.p.m. and torque (see page 1124)
- Keyway DIN 6885 (see page A16)
- Cross holes GN 110.1 (see page A18)
- Stainless Steel characteristics (see page A26)
- ISO-Fundamental Tolerances (see page A21)

Universal joints

for ordinary applications

SPECIFICATION

Types

- Type **EG**: single, friction bearing
- Type **DG**: double, friction bearing

Steel

- not hardened
- blackened

INFORMATION

Universal joints GN 9080 are a simple and very competitively priced variant.
They can only be used for applications with low revolutions. Typical applications are all types of manual operations such as the adjustment of louvers.

TECHNICAL INFORMATION

- Cross holes GN 110.1 (see page A17)
- ISO-Fundamental Tolerances (see page A21)

GN 808.1

Gaiters

for universal joints DIN 808

SPECIFICATION

Types

- Type **E**: for single joints
- Type **D**: for double joints

Type **E**
Rubber (CR)
black

Type **D**
Elastomer plastic
smooth PVC
black

INFORMATION

Gaiters GN 808.1 give universal joints full protection against ingress of dirt.
At the same time they can be filled with grease which gives long term lubrication for friction bearings.
The gaiters are secured at each end with two cable ties, which are supplied each sleeve.

TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)

Universal joint shafts with friction bearing

with longitudinal compensation

SPECIFICATION

Bore code

- Version **K**: with keyway

Steel blank

Joint bearing areas / pins / bearing sleeves
case hardened

INFORMATION

Universal joint shafts with friction bearing GN 808.2 not only join the offset between two shafts, but also enable the alignment of lengths, which depending on the overall length l_1 enables the corresponding extraction length l_2. The power transmission is achieved by two universal joints DIN 808 (type EG) (see page 1126) a splined shaft and a sliding sleeve.
It is important to check the accuracy when connec-ting the splined shaft to the sliding sleeve: The markings -> <- have to be opposite to each other. Any kind of misconnection leads to an inhomogeneous output and to a quick abrasion.

ON REQUEST

- different length l_1 - l_2
- Bores without keyway
- Bores with square
- with other or unequal bores

TECHNICAL INFORMATION

- Permissible r.p.m. and torque (see page 1124)
- Keyway DIN 6885 (see page A16)
- Cross holes GN 110.1 (see page A17)
- ISO-Fundamental Tolerances (see page A21)

GN 808.3

Universal joint shafts with needle bearing

with longitudinal compensation

SPECIFICATION

Bore codes

- Version **K**: with keyway

Steel
blank

Joint bearing areas, pins
case hardened

INFORMATION

Universal joint shafts with needle bearing GN 808.3 not only join the offset between two shafts, but also enable the alignment of lengths, which depending on the overall length l1 enables the corresponding extraction length l2. The power transmission is achive-bed by two universal joints DIN 808 (type EW) (see page 1126) a splined shaft and a sliding sleeve . It is important to check the accuracy when connecting the splined shaft to the sliding sleeve. The markings -> <- have to be opposite to each other. Any kind of misconnection leads to an inhomogeneous output and to a quick abrasion.

ON REQUEST

- different length l_1 - l_2
- Bores without keyway
- Bores with square
- with other or unequal bores

TECHNICAL INFORMATION

- Permissible r.p.m. and torque (see page 1125)
- Keyway DIN 6885 (see page A16)
- Cross holes GN 110 (see page A17)
- ISO-Fundamental Tolerances (see page A21)

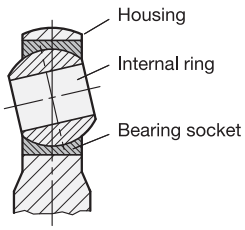
Ball joint heads DIN ISO 12240-4 / DIN 12240-1, Series K

Technical information



Steel version

Type **N**
Housing steel, zinc plated
Pairings
Internal ring steel, hardened
Bearing socket brass
lubrication possible.

Features of general use:

For general use, and in particular for continuously changing thrust and shock loads in radial and axial plane.

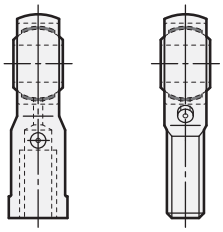
Type **W**
Housing steel, zinc plated
Pairings
Internal ring steel, hardened
Bearing socket steel, zinc plated with PTFE-insert
self lubricated.

For general use, especially for application under dynamic operating conditions.
Load bearing capacitiy than Type **N.**

Ball joint heads

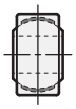
with female thread

with threaded bolt



Ball joints

without housing



Stainless Steel version

Type **NH**
Housing Stainless Steel
Pairings
Internal ring, hardened, hard chrome plated
Bearing socket bronze
lubrication possible.

As Type **N**
for use in corrosion endangered area.

Type **WH**
Housing Stainless Steel
Pairings
Internal ring steel, hardened
Bearing socket bronze, with PTFE-insert
self lubricated.

As Type **W**
for use in corrosion endangered area.

Type **WK**
Housing Stainless Steel
Pairings
Internal ring Stainless Steel, hardened
Bearing socket Stainless Steel, with PTFE-insert
self lubricated.

As Type **W**
for use in areas where the highest degree of corrosion resistance is of paramount importance. Such as for instance in the food industry.

Bearing play

Bearing play refers to the amount of play by which the internal ring inside a bearing socket without lubrication can be moved either a radial or an axial plane.

Types **N, NH** lubrication possible		Types **W, WH, WK** self lubricated		
d_1 Bore internal ring	Radial bearing play	**d_1** Bore internal ring	Radial bearing play	Axial bearing play
5 ... 10	0.005 ... 0.035	5 ... 10	0,005 ... 0.030	2 to 3 times radial play
12 ... 20	0.010 ... 0.040	12 ... 18	0,005 ... 0.035	
22 ... 30	0.010 ... 0.050	20 ... 30	0,005 ... 0.055	

Load applied to obtain the measured results: 100 N at room temperature.

Lubrication

Ball joint heads of type **N** (lubrication possible) require regular lubrication. On delivery the ball joint heads are not lubricated. The initial lubrication takes place when installed. Within the temperature range of -20 °C to +125 °C, a multipurose grease proved to be adequate. Under extreme conditions a high quality grease such as for instance Gleitmo 805 K should be used. Ball joint heads of the type **W** (self lubricated) **must never be lubricated.** The internal ring moves on a PTFE-insert of the bearing socket.

Ball joint heads DIN ISO 12240-4 / DIN ISO 12240-1, Series K

Technical information

Operating temperature

Ball joint heads of the type **N** (lubrication possible) can be used within the temperature range -50 °C to +200 °C and if use with a high temperature grease even higher. Ball joint heads of the type **W** (self lubricated) can be used in the temperature range of -50 °C bis +200 °C. In general use at higher temperature is possible, but this will of course shorten the working life of the head.

Load values

Load values are bearing related values, arrived at from the raw material data of the basic material of construction used. The latter is used to determine the choice of a ball joint head for a given load. These might, however, have to be reduced to meet the requirements of particular circumstances.

Static load values Co in kN

Co gives the permitted radial static load which can be applied to a ball joint head with the weakest cross section without causing permanent deformation. The Co-values quoted in the catalogue table have been calculated, based on the corresponding raw material specification. Subsequently a random number of the ball joint heads was stress tested at room temperature. Each and every time the stress tests were based on using up to 80 % before the onset of deformation thus leaving a safety factor of 1.25. The static value Co is used to obtain the permissible axial load which in general is limited by the mounting strength of the internal bearing. To obtain the maximum axial load Fa tests were carried out at the largest permissible slant angle and the results obtained are shown in the table below:
Fa = 0.4 Co for type N
Fa = 0.2 Co for types NH, W, WH, WK

GN 648.1

Ball joint heads with female thread

SPECIFICATION

Types (pairings)

- Type **N**: Brass / Steel lubrication possible
- Type **W**: Steel-PTFE / Steel self lubricated

Housing Steel

- zinc plated, blue passivated
- d_1 = 5 up to 12: machined
- d_1 = 14 up to 25: forged

Pairings

Type N (lubrication possible)
Bearing socket
Brass, CuZn40Al1

Internal ring
Steel, 100Cr6
hardened, ground, polished

Type W (self lubricated)
Bearing socket
Steel, zinc plated
with PTFE-insert

Internal ring
Steel, 100Cr6
hardened, ground, polished

INFORMATION

Ball joint heads GN 648.1 are similar to DIN ISO 12240-4, series K (formerly DIN 648 K).

- More information to ball joints as well as load capacity (see page 1134)

ON REQUEST

- narrow model (ISO 12240-1, series E)

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

Ball joints heads with threaded bolt

SPECIFICATION

Types (pairings)

- Type **N**: Brass / Steel lubrication possible
- Type **W**: Steel-PTFE / Steel self lubricated

Housing Steel

- zinc plated, blue passivated
- d_1 = 5 up to 12: machined
- d_1 = 14 up to 25: forged

Pairings

Type N (lubrication possible)
Bearing socket
Brass, CuZn40Al1

Internal ring
Steel, 100Cr6
hardened, ground, polished

Type W (self lubricated)
Bearing socket
Steel, zinc plated
with PTFE-insert

Internal ring
Steel, 100Cr6
hardened, ground, polished

INFORMATION

Ball joint heads GN 648.2 are similar to DIN ISO 12240-4, series K (formerly DIN 648 K).

- More information to ball joints as well as load capacity (see page 1134)

ON REQUEST

- narrow model (ISO 12240-1, series E)

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

Stainless Steel-Ball joint heads with female thread

SPECIFICATION

Types (pairings)

- Type **NH**: Bronze / Steel lubrication possible
- Type **WH**: Bronze-PTFE / Steel self lubricated
- Type **WK**: Stainless Steel-PTFE / Stainless Steel, self lubricated

Housing Stainless Steel AISI 431
forged, polished

Pairings

Type NH (lubrication possible)
Bearing socket Bronze CuSn8

Internal ring Steel 100 Cr6
hardened, ground, polished
hard chrome plated

Type WH (self lubricated)
Bearing socket Bronze CuSN8
with PTFE-insert

Internal ring Steel 100Cr6
hardened, ground, polished
hard chrome plated

Type WK (self lubricated)
Bearing socket, Stainless Steel
AISI 316Ti with PTFE-insert

Internal ring
Stainless Steel AISI 420
hardened, ground, polished

Rod ends

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer.

ROD SPHERICAL CAP
Polyamide-based self-lubricating technopolymer (PA).

STANDARD EXECUTIONS
- **BJT:** with threaded hole.
- **BJT-p:** with threaded pin.

FEATURES AND APPLICATIONS
BJT. rod ends are remarkably suitable for rotary, oscillating and linear movements even in particularly aggressive environments and when water or humidity, fine dusts, dirt, fabrics and machining residues are present.
The shaft rotary movement can take place directly on the inner diameter of the spherical cap, made of self-lubricating material.
Features of the technopolymer rod ends:
- totally corrosion resistant even in the presence of chemicals;
- high strength to saline mist;
- high mechanical strength to the applied loads;
- lightness combined with high-rigidity;
- maintenance free;
- compensation of possible misalignments;
- absorption of vibrations and transverse stresses;
- noise minimization.

GN 751.1

Fork joints

with rotating shaft

SPECIFICATION

Types

- Type **A**: without pin
- Type **KL**: Pin with KL-shaft safety
- Type **SL**: Pin with SL-shaft safety

Steel

- Tensile strength class 5
- zinc plated, blue passivated

Shaft safetys

- Spring steel
- hardened and tempered
- zinc plated, blue passivated

INFORMATION

Fork joints GN 751.1 basically correspond to the fork head of DIN 71752 (Type A), but, unlike the DIN element, they have a rotating shaft and an additional bolt with axial shaft lock (Type KL and SL) which can be mounted and dismantled without tools (see page 1152). The rotating shaft allows non-dynamic radial movements to be compensated, movements which may occur e.g. when using cable winches. Also, there is no need for the otherwise necessary alignment of joint heads during assembly.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)
- Strength values of nuts (see page A20)

Safety circlip DIN 471
Stainless Steel
German Material No. 1.4122

INFORMATION

Fork joints GN 751 consist of a fork head according DIN 71752 and a pin with KL-shaft (Type KL and SL) a pin with snap-on spring (Type B). Both versions can be dismantled without tools and moniter.
Size d_1 = 12 is supplied with a fine thread M12x1.5 according to DIN. In practice, however, M12x1.25 is preferred. Standard DIN 71752 does not foresee size d_1 = 20.

ON REQUEST

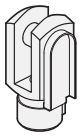
Fork heads in accordance with DIN 71752 (see page 1152) with d_1 = 25, 30, 35, 42 and 50 (only Steel Version).

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)
- Stainless Steel characteristics (see page A26)

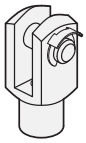
Types of fork joint shafts

Snap-on spring



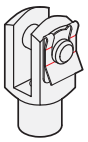
The snap-on spring pin is easily mounted and dismantled. It is therefore particularly suitable for applications where the articulated connection needs to be loosened often.

KL-shaft safety



The pin with side mount ring can be fitted and dismantled without tools, i. e. by hand.

SL-shaft safety



The pin with safety clip requires a tool for dismantling (e.g. a screw driver). It is therefore better secured.

Forks

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer.

STANDARD EXECUTIONS
Threaded hole.
- **FJT+PC:** with clip pin.
- **FJT+S:** with pin and seeger ring.

FEATURES AND APPLICATIONS
FJT. forks are remarkably suitable for actuation for example of pneumatic cylinders even when water and humidity are present.
Features of the technopolymer forks:
- totally corrosion resistant even when humidity and chemicals are present;
- high strength to saline mist;
- high mechanical strength to the applied loads;
- lightness combined with high-rigidity;
- resistant to continuous washing cycles with solvents and detergents, so they are suitable, for example, in applications in the food and pharmaceutical sectors;
- excellent shock-absorbing features;
- noise minimization.

Fork heads

SPECIFICATION

Version in Steel

Steel

- Tensile strength class 5
- zinc plated, blue passivated

Version in Aluminium

Aluminium **AL**
anodized, black

Version in Stainless Steel

Stainless Steel AISI 303 **NI**
blank

INFORMATION

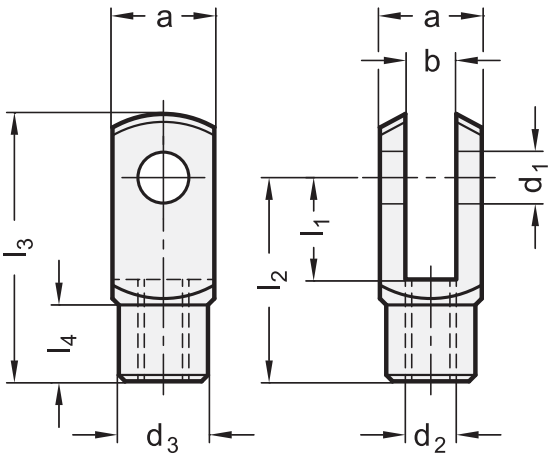
Size d1= 12 is supplied with a fine thrad M12 x1.5 according to DIN. In practice, however, M12 x1.25 is preferred. DIN 71752 does not foresee size d1= 20.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)
- Stainless Steel characteristics (see page A26)
- Strength values of nuts (see page A20)

ON REQUEST

- Fork heads in accordance with DIN 71752 with d1 = 25, 30, 35, 42 and 50 (only Steel-Version)
- Fork heads in accordane with DIN 71752 with d1 = 30 and 35 (only Stainless Steel-Version)



*Complete with type index of the Fork heads (AL or NI)

Joint pieces

Steel / Stainless Steel, for fork joints GN 751

SPECIFICATION

Steel

- Tensile strength class 5
- zinc plated, blue passivated

Stainless Steel AISI 303 **NI**

INFORMATION

Joint pieces GN 752 are designed to be used in combination with for heads DIN 71752 (see page 1152) and GN 751 (see page 1148) respectively fork joints.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)
- Stainless Steel characteristics (see page A26)
- Strength values of nuts (see page A20)

Angled ball joints

with threaded ball and rivet ball shanks

SPECIFICATION

Version in Steel

Types

- Type **CS**: with threaded ball shank with safety catch
- Type **C**: with threaded ball shank without safety catch
- Type **BS**: with rivet ball shank, with safety catch
- Type **B**: with rivet ball shank, without safety catch

Steel

- Tensile strength class 5
- zinc plated, colourless passivated

Ball
Steel

- hardened
- ball seat lubricated

Version in Stainless Steel

Types

- Type **CSN**: with threaded ball shank, with safety catch
- Type **CN**: with threaded ball shank, without safety catch

Stainless Steel AISI 303

Ball
Stainless Steel

- not hardened
- ball seat greased

INFORMATION

Angled ball joints DIN 71802 consist of a ball socket DIN 71805 and a ball shank DIN 71803.
The angle of rotation for the type with safety catch (Types CS, BS, CSN) ist 15°, without safety catch (Types C, B, CN) is 18°.
For assembly the ball ist pushed through the circlip which acts as a retainer. Should the retaining force (see pull-off force in the table above) between ball and socket not be sufficient, this can be increased by adding a safety catch, which can easily be fitted.
To protect the angled ball point, a dust cap GN 710 (see page 1158) can be added.
The hexagon nut is part of the angled ball joints.
Dust caps GN 710 (see page 1158) have to be ordered seperately.

ON REQUEST

- smooth specification (Ball seat with play)
- Ball studs DIN 71803
- Ball sockets DIN 71805
- Axial joints (ball socket and ball shank in one axis)

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)
- Stainless Steel characteristics (see page A26)
- Strength values of nuts (see page A20)

GN 782

Axial ball joints

SPECIFICATION

Types

- Type **KS**: Ball with male thread
- Type **KI**: Ball with female thread

Identification No.

- No. **1**: Mounting socket with female thread
- No. **2**: Mounting socket with male thread

Steel
zinc plated, blue passivated

Brake piece
Technopolymer (Polyamide PA)

INFORMATION

The clamping nut of the axial ball joints GN 782 can be set to give a required thrust on the Belleville spring washers in order to increase the resistance to the ball movement.
At the same time the Belleville spring washers act as safety washers for the screws.
Once the max. thrust to the Belleville spring washers is reached the ball arm is firmly immobilised in position over the clamping nut and screw.

TECHNICAL INFORMATION

- Plastic characteristics (see page A2)

Swivel ball joints

Aluminum

SPECIFICATION

Types

- Type **A**: Ball with female thread
- Type **B**: Ball with male thread

Identification no.

- No. **1**: Clamping with adjustable hand lever (only for d_1 = 39 and 49)
- No. **2**: Clamping set with screw

Housing
Aluminum
anodized black **ELS**

Base plate, ball
Aluminium, blank

Adjustable hand lever (Identification no. 1)

- Zinc die casting, plastic coated, silver RAL 9006, textured finish
- Threaded stud and retaining screw, Stainless Steel AISI 303

Set screw (Identification no. 2)
Stainless Steel AISI 304

INFORMATION

GN 784 swivel ball joints allow precise and variable adjustment of the ball pivot within the rotation range. This is a particular advantage when adjusting scanners, cameras, lighting, monitors, etc.
Thanks to the efficient clamping mechanism, only small amounts of torque on the clamping screw result in comparatively strong clamping pressure on the ball. This force is easily applied by the clamping lever (Identification no. 1).
The ball joint can be mounted from below with the d_4 internal thread or together with the GN 784.1 (see page 1162) flange, available as an accessory, using three through-holes from above.
For a permanent high stop torque, the contact surfaces of the balls must be kept free of grease. Exceeding the recommended tightening torque increases the securing of the ball joint in its end position, but may result in increased wear and potential failure of the clamping mechanism.

ON REQUEST

- Clamping with star knob DIN 6335 (see page 234)

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

Flanges

for mounting clamps with swivel ball joint GN 784

SPECIFICATION

Stainless Steel AISI 304
matte, tumbled finish **MT**

Countersunk screw DIN 7991
Stainless Steel AISI 304

Half-length tapered groove pin DIN 8745
Stainless Steel AISI 304

INFORMATION

The GN 784.1 flanges are mounted from below into the GN 784 swivel ball joints (see page 1160). A half-length tapered groove pin prevents any rotation.
The flange enables the swivel ball joints to be mounted on the upper surface. The d_2 section with the three d_3 drill holes is configured so that standard screws with washers can be used.
The half-length tapered groove pin is mounted on the flange. The countersunk screw is included separately.

Quick-fit couplings

with radial off-set compensation

SPECIFICATION

Types

- Type **A**: with male thread
- Type **B**: with female thread

Steel

- tempered
- phosphated

INFORMATION

Quick-fit couplings GN 240 have been designed for the purpose of compensating a radial shaft off-set (x). A typical application is the axial link to a piston rod of a cylinder operating in any type of fixture or system.
The coupling is **not** designed for the transfer of torque.

GN 240.2

Quick-fit couplings

with angle- and radial off-set compensation

SPECIFICATION

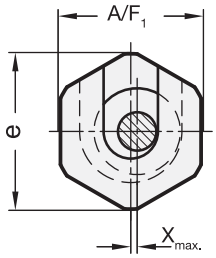
Steel

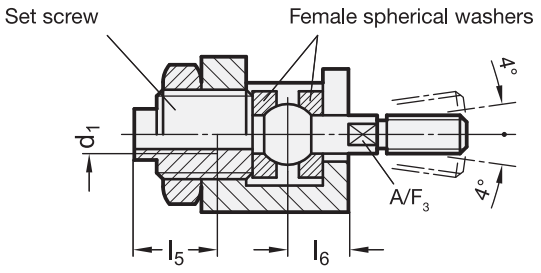
- tempered
- phosphated

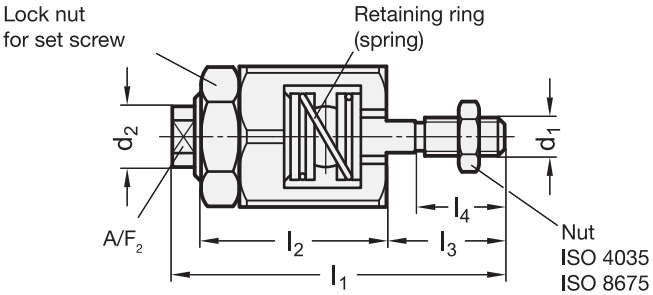
Retaining ring (spring)
Stainless Steel AISI 631

INFORMATION

Quick-fit couplings GN 240.2 have been designed to compensate a **radial** and **angular** off-set. Furthermore they are axially freely adjustable via the set screw.
A typical application is the axial link to a piston rod of a cylinder operating in any type of fixture or system.
The coupling is renowned by its very compact construction without any loose components.
It is **not** designed for the transfer of torque.







GN 240.2

DESIGNED
FOR ENGINEERING

11 Levelling elements

Levelling elements

Technopolymer base, steel or stainless steel stem

BASE

Polyamide based (PA) technopolymer with adjusting hexagon, black colour, matte finish.

STANDARD EXECUTIONS

- **LX**: zinc-plated steel threaded stem.
- **LX-S**: zinc-plated steel threaded stem, base with screwdriver slot.
- **LX-SST**: AISI 304 stainless steel threaded stem.
- **LX-SST-S**: AISI 304 stainless steel threaded stem, base with screwdriver slot.

TECHNICAL DATA

It's the user's responsibility to determine whether the product is suitable for the intended purpose according to the actual conditions of use.

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

Levelling elements

Technopolymer base, steel stem with hexagon socket at the upper end

BASE
Polyamide based (PA) technopolymer with adjusting hexagon, black colour, matte finish.

STANDARD EXECUTION
Zinc-plated steel threaded stem with hexagon socket at the upper end.
Base with screwdriver cross slot.

TECHNICAL DATA
It's the user's responsibility to determine whether the product is suitable for the intended purpose according to the actual conditions of use.

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

Levelling elements

Technopolymer base, steel stem

BASE
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ARTICULATED STEM
Threaded zinc-plated steel with regulation hexagon.

STANDARD EXECUTIONS
- **LS.A**: without no-slip disk.
- **LS.A-AS:** with NBR rubber no-slip disk, hardness 70 Shore A, supplied assembled to the base.

FEATURES
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disk on page 1223).

ORDER INFORMATION
The levelling elements are supplied unassembled to make carriage and storage easier. The components (base and stem) are supplied in separate packing: less volume taken and better protection from scratches and dirt.
To order bases and stems separately, see:
table of the possible combinations Bases/Stems on page 1229.

ACCESSORIES ON REQUEST
Zinc-plated steel nut (see Nuts NT. on page 1223).

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

Data with no-slip disk mounted.

LS.A-SST

Levelling elements

Technopolymer base, stainless steel stem

BASE
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ARTICULATED STEM
Threaded AISI 304 stainless steel with regulation hexagon.

STANDARD EXECUTIONS
- **LS.A-SST**: without no-slip disk.
- **LS.A-AS-SST**: with NBR rubber no-slip disk, hardness 70 Shore A, supplied assembled to the base.

FEATURES
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disk on page 1223).

ORDER INFORMATION
The levelling elements are supplied unassembled to make carriage and storage easier. The components (base and stem) are supplied in separate packing: less volume taken and better protection from scratches and dirt.
To order bases and stems separately, see:
table of the possible combinations Bases/Stems on page 1229.

ACCESSORIES ON REQUEST
AISI 304 stainless steel nut (see Nuts NT. on page 1223).

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.
# Data with no-slip disk mounted.

LSQ.A-SST

INOX STAINLESS STEEL · RoHS · PA · NBR · +100° -30°

Levelling elements

Technopolymer base, stainless steel stem

BASE
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ARTICULATED STEM
Threaded AISI 304 stainless steel with adjusting square.

STANDARD EXECUTIONS
- **LSQ.A-SST**: without no-slip disk.
- **LSQ.A-AS-SST**: with NBR rubber no-slip disk, hardness 70 Shore A, supplied assembled to the base.

FEATURES
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disk on page 1223).

ORDER INFORMATION
The levelling elements are supplied unassembled to make carriage and storage easier. The components (base and stem) are supplied in separate packing: less volume taken and better protection from scratches and dirt.
To order bases and stems separately, see:
table of the possible combinations Bases/Stems on page 1229.

ACCESSORIES ON REQUEST
AISI 304 stainless steel nut (see Nuts NT. on page 1223).

ELESA Original design

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

Data with no-slip disk mounted.

Ball jointed levelling feet

Steel / Stainless Steel

SPECIFICATION

Version in Steel ST

Thrust pad
Plastic (Polyacetal POM)

- temperature resistant up to 80 °C
- black, matt

Threaded stud
Steel, blackened

Tensile strength class 5.8

Version in Stainless Steel NI

Thrust pad
Plastic (Polyacetal POM)

- temperature resistant up to 80 °C
- black, matt

Threaded stud
Stainless Steel AISI 303

Version completely in Stainless Steel NV

Thrust pad
Stainless Steel AISI 303

- O-ring rubber FPM (Viton®)
- temperature resistant up to 200 °C

Threaded stud
Stainless Steel AISI 303

INFORMATION

Ball jointed levelling feet GN 638 feature a smaller size ball diameter than the trunk of the threaded stud. As a result the studs can be screwed into position from the ball side. The ball end can easily be hammered in and also dismantled.
Details regarding the static load capacity have been established by a series of tests but are indicative only. For these tests the loads have been placed vertically and centrally over the stud. At the measured load of 3.5 kN there was no remaining deformation visible on the thrust pad nor was there any breakage.

TECHNICAL INFORMATION

- Plastic characteristics (see page A2)
- Stainless Steel characteristics (see page A26)
- Strength values of screws (see page A20)

GN 339

Levelling mount

Steel / Stainless Steel / Threaded stem, not adjustable

SPECIFICATION

Types

- Type **KS**: with plastic cap, gliding
- Type **KR**: with plastic cap, non-gliding

Version in Steel ST

- Tensile strength class 5.8
- zinc plated, blue passivated
- Hexagon nut ISO 4035, Steel zinc plated, blue passivated

Version in Stainless Steel NI

- AISI 303
- Hexagon nut ISO 4035, Stainless Steel AISI 304

Plastic caps:

Type KS
Technopolymer (Polyacetal POM)
white (natural colour) RAL 9001

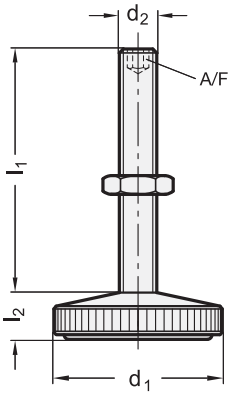
Type KR
Elastomer (TPE)
73 shore A ≈, black

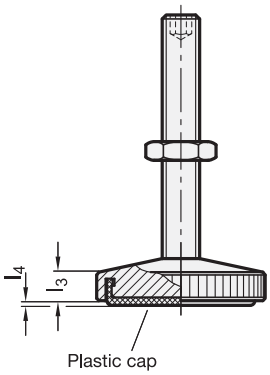
INFORMATION

Levelling mount GN 339 are used for applications in cases where no jointed link is required between foot and adjusting screw.
For this reason they offer the advantage of reduced height.
The gliding and/or the non-gliding protective cap is safely fixed in the foot.

TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)
- Plastic characteristics (see page A2)
- Stainless Steel characteristics (see page A26)
- Strength values of screws (see page A20)





*Complete with type index of the Levelling mount

Weight type ST

GN 343.3

Levelling feet

Foot plastic, female thread

SPECIFICATION

Types

- Type **A**: without rubber underlay
- Type **G**: with rubber underlay

Foot: Plastic (Polyamide PA)

- glass fibre reinforced
- black, matt
- temperature resistant up to 100 °C

Female thread
Steel

- Tensile strength class 5.8
- zinc plated, blue passivated

Hexagon nut ISO 4032
Steel
zinc plated, blue passivated

Rubber underlay (NBR)
70 Shore A, black

INFORMATION

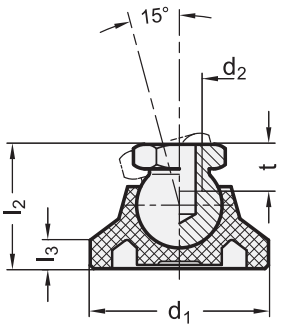
Levelling feet GN 343.3 are capable of withstanding high static loads through the use of a high density plastic material coupled with a design which distributes the load over a larger area.
Exceeding the static values specified in the table could lead to failure of the plastic component.
The above values have been arrived at by a series of load tests whereby a defined number of levelling feet were subjected to a vertical load over a defined period.
Under normal operating conditions side loading or angular loading is not uncommon and the load capacity would be considerably reduced which must be taken into consideration.
Levelling feet GN 343.3 are supplied assembled, but are removable.

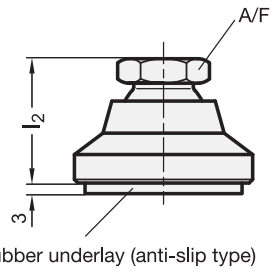
TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)
- Plastic characteristics (see page A2)

ON REQUEST

- ESD version (conductive plastic cap to avoid electrostatic charging)





Rubber underlay (anti-slip type)

*Complete with type index of the Levelling feet (A or G)

INFORMATION

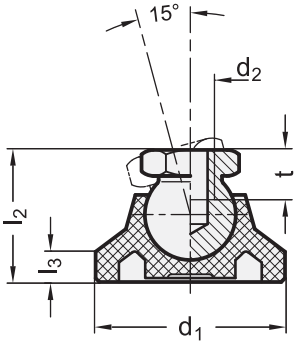
Levelling feet GN 343.7 are capable of withstanding high static loads through the use of a high density plastic material coupled with a design which distributes the load over a larger area.
Exceeding the static values specified in the table could lead to failure of the plastic component.
The values have been arrived at by a series of load tests whereby a defined number of levelling feet were subjected to a vertical load over a defined period.
Under normal operating conditions side loading or angular loading is not uncommon and the load capacity would be considerably reduced which must be taken into consideration.
Levelling feet GN 343.7 are supplied assembled, but are removable.

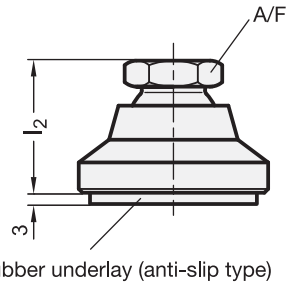
TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Elastomer characteristics (see page A32)
- Plastic characteristics (see pageA2)

ON REQUEST

- ESD version (conductive plastic cap to avoid electrostatic charging)





Rubber underlay (anti-slip type)

*Complete with type index of the Levelling feet (A or G)

A without rubber underlay

G with rubber underlay

Weight type A

Levelling feet

Foot, threaded stud steel

SPECIFICATION

Types

- Type **OS**: without plastic cap
- Type **KS**: with plastic cap, gliding
- Type **KR**: with plastic cap, non-gliding
- Type **KSE**: with plastic cap, gliding, electrically conductive (antistatic)
- Type **KRE**: with plastic cap, non-gliding, electrically conductive (antistatic)

Steel
Tensile strength class 5.8
zinc plated, blue passivated

Type **KS / KSE**
Plastic cap Polyacetal (POM)

KS: white (natural colour) RAL 9001
KSE: black, electrically conductive
Surface resistivity: $< 10^6\ \Omega$
Volume resistivity: $< 10^7\ \Omega$
DIN EN 61340-5-1 / 61340-2-3

Type **KR / KRE**
Plastic cap Elastomer (TPE), 78 Shore A ≈

KR: black
KRE: black, electrically conductive
Surface resistivity: $< 10^6\ \Omega$
Volume resistivity: $< 10^7\ \Omega$
DIN EN 61340-5-1 / 61340-2-3

Hexagon nut ISO 4032
Steel, zinc plated, blue passivated

INFORMATION

The static load of the levelling feet GN 343.2 is limited by the load capacity of the ball joint threaded stud (tensile strength class 5.8). The static load values (only valid for Type OS / KS) in the table refer to a net vertical load in relation to the levelling foot. Under normal operating conditions side loading or angular loading is not uncommon and the load capacity would be considerably reduced which must be taken into consideration.
Levelling feet GN 343.2 cannot be disassembled.

KR: black

KRE: black, electrically conductive
Surface resistivity: < 10^6 Ω
Volume resistivity: < 10^7 Ω
DIN EN 61340-5-1 / 61340-2-3

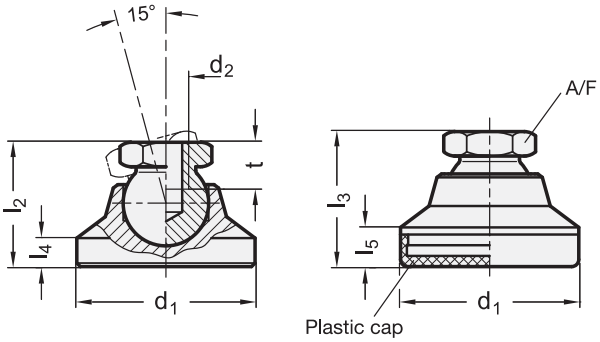
INFORMATION

The static load of the levelling mounts GN 343.1 is limited by the load capacity of the ball joint with threaded stud (tensile strength class 5.8). The static load values (only valid for Type OS / KS) in the table refer to a net vertical load in relation to the levelling foot. Under normal operating conditions side loading or angular loading is not uncommon and the load capacity would be considerably reduced which must be taken into consideration.
Levelling feet GN 343.1 cannot be disassembled.

TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)
- Plastic characteristics (see page A2)
- Strength values (see page A20)



*Complete with type index of the Levelling feet

Stainless Steel-Levelling feet

Female thread

SPECIFICATION

Types

- Type **OS**: without plastic cap
- Type **KS**: with plastic cap, gliding
- Type **KR**: with plastic cap, non-gliding
- Type **KSE**: with plastic cap, gliding, electrically conductive (antistatic)
- Type **KRE**: with plastic cap, non-gliding, electrically conductive (antistatic)

Stainless Steel AISI 303

Type **KS / KSE**
Plastic cap Polyacetal (POM)

KS: white (natural colour) RAL 9001

KSE: black, electrically conductive
Surface resistivity: $< 10^6\ \Omega$
Volume resistivity: $< 10^7\ \Omega$
DIN EN 61340-5-1 / 61340-2-3

Type **KR / KRE**
Plastic cap elastomer (TPE), 78 Shore A ≈

KR: black

KRE: black, electrically conductive
Surface resistivity: $< 10^6\ \Omega$
Volume resistivity: $< 10^7\ \Omega$
DIN EN 61340-5-1 / 61340-2-3

INFORMATION

The static load of the Stainless Steel-Levelling feet GN 343.5 is limited by the load capacity of the ball joint (AISI 303).
The static load values (only valid for Type OS, KS and KSE) in the above table refer to a net vertical load in relation to the levelling foot.
Under normal operating conditions side loading or angular loading is not uncommon and the load capacity would be considerably reduced which must be taken into consideration.
Levelling feet GN 343.5 cannot be disassembled.

Levelling elements

Technopolymer base, steel stem

BASE
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ARTICULATED STEM
Threaded zinc-plated steel with regulation hexagon.

STANDARD EXECUTIONS
- **LV.A**: without no-slip disk.
- **LV.A-AS:** with NBR rubber no-slip disk, hardness 70 Shore A, supplied assembled to the base.

FEATURES
The special knurling under the lower lip of the base provides excellent stability and grip when using the levelling element without no-slip disk even on surfaces that are not perfectly flat.
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disk on page 1223).

ORDER INFORMATION
The levelling elements are supplied unassembled to make carriage and storage easier. The components (base and stem) are supplied in separate packing: less volume taken and better protection from scratches and dirt.
To order bases and stems separately, see:
table of the possible combinations Bases/Stems on page 1229.

ACCESSORIES ON REQUEST
Zinc-plated steel nut (see Nuts NT. on page 1223).

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

Data with no-slip disk mounted.

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

Data with no-slip disk mounted.

LV.A-SST

Levelling elements

Technopolymer base, stainless steel stem

BASE
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ARTICULATED STEM
Threaded AISI 304 stainless steel with regulation hexagon.

STANDARD EXECUTIONS
- **LV.A-SST**: without no-slip disk.
- **LV.A-AS-SST:** with NBR rubber no-slip disk, hardness 70 Shore A, supplied assembled to the base.

FEATURES
The special knurling under the lower lip of the base provides excellent stability and grip when using the levelling element without no-slip disk even on surfaces that are not perfectly flat.
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disk on page 1223).

ORDER INFORMATION
The levelling elements are supplied unassembled to make carriage and storage easier. The components (base and stem) are supplied in separate packing: less volume taken and better protection from scratches and dirt.
To order bases and stems separately, see:
table of the possible combinations Bases/Stems on page 1229.

ACCESSORIES ON REQUEST
AISI 304 stainless steel nut (see Nuts NT. on page 1223).

ELESA Original design

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

Data with no-slip disk mounted.

LV.A-ESD-C

Levelling elements

ESD conductive technopolymer base, steel stem

BASE
Glass-fibre reinforced polyamide based (PA) special conductive technopolymer, black colour, matte finish.
Surface resistivity = 10^3 Ω (ASTM D257 measuring method).
Volume resistivity = 10^3 Ωcm (ASTM D257 measuring method).

ARTICULATED STEM
Threaded zinc-plated steel with regulation hexagon.

STANDARD EXECUTIONS
- **LV.A-ESD-C**: without no-slip disk.
- **LV.A-AS-ESD-C**: with NBR conductive rubber, hardness 70 Shore A, supplied assembled.

Surface resistivity = 10^3 Ω (ASTM D991 measuring method).
Volume resistivity = 10^3 Ωcm (ASTM D991 measuring method).

FEATURES AND APPLICATIONS
The special conductive technopolymer (ESD-C Electrostatic Discharge Conductive) prevents the accumulation of electrostatic charge.
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disk on page 1223).
The bases are suitable for "ESD PROTECTED AREA" (EPA) where components, which are susceptible to electrostatic discharges, are handled.
The (ESD-C) indelibly printed mark on the surface of the levelling elements bases identifies the particular conductive features of the material according to EN 100015/1 and IEC 61340-5-1.

ORDER INFORMATION
The levelling elements are supplied unassembled to make carriage and storage easier. The components (base and stem) are supplied in separate packing: less volume taken and better protection from scratches and dirt.
To order bases and stems separately, see:
table of the possible combinations Bases/Stems on page 1229.

ACCESSORIES ON REQUEST
Zinc-plated steel nut (see Nuts NT. on page 1223).

ELESA Original design

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

Data with no-slip disk mounted.

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

Data with no-slip disk mounted.

LV.A-SST-ESD-C

Levelling elements

ESD conductive technopolymer base, stainless steel stem

BASE

Glass-fibre reinforced polyamide based (PA) special conductive technopolymer, black colour, matte finish.
Surface resistivity = 10^3 Ω (ASTM D257 measuring method).
Volume resistivity = 10^3 Ωcm (ASTM D257 measuring method).

ARTICULATED STEM

Threaded AISI 304 stainless steel with regulation hexagon.

STANDARD EXECUTIONS

- **LV.A-SST-ESD-C**: without no-slip disk.
- **LV.A-AS-SST-ESD-C**: with NBR conductive rubber, hardness 70 Shore A, supplied assembled.

Surface resistivity = 10^3 Ω (ASTM D257 measuring method).
Volume resistivity = 10^3 Ωcm (ASTM D257 measuring method).

FEATURES AND APPLICATIONS

The special conductive technopolymer (ESD-C Electrostatic Discharge Conductive) prevents the accumulation of electrostatic charge.
The bases are suitable for "ESD PROTECTED AREA" (EPA) where components, which are susceptible to electrostatic discharges, are handled.
The (ESD-C) indelibly printed mark on the surface of the levelling elements bases identifies the particular conductive features of the material according to EN 100015/1 and IEC 61340-5-1.
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disks on page 1223).

ORDER INFORMATION

The levelling elements are supplied unassembled to make carriage and storage easier. The components (base and stem) are supplied in separate packing: less volume taken and better protection from scratches and dirt.
To order bases and stems separately, see:
table of the possible combinations Bases/Stems on page 1229.

ACCESSORIES ON REQUEST

AISI 304 stainless steel nut (see Nuts NT. on page 1223).

ELESA Original design

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.
# Data with no-slip disk mounted.

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.
# Data with no-slip disk mounted.

Levelling elements

Technopolymer base, stainless steel stem

BASE
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ARTICULATED STEM
Threaded AISI 304 stainless steel with adjusting square.

STANDARD EXECUTIONS
- **LVQ.A-SST**: without no-slip disk.
- **LVQ.A-AS-SST**: with NBR rubber no-slip disk, hardness 70 Shore A, supplied assembled to the base.

FEATURES
The special knurling under the lower lip of the base provides excellent stability and grip when using the levelling element without no-slip disk even on surfaces that are not perfectly flat.
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disks on page 1223).

ORDER INFORMATION
The levelling elements are supplied unassembled to make carriage and storage easier. The components (base and stem) are supplied in separate packing: less volume taken and better protection from scratches and dirt.
To order bases and stems separately, see:
table of the possible combinations Bases/Stems on page 1229.

ACCESSORIES ON REQUEST
AISI 304 stainless steel nut (see Nuts NT. on page 1223).

Levelling elements for ground mounting

Technopolymer base, steel stem

ELESA Original design

BASE
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ARTICULATED STEM
Threaded zinc-plated steel with regulation hexagon.

STANDARD EXECUTIONS
- **LV.F**: without no-slip disk.
- **LV.F-AS**: with NBR rubber no-slip disk, hardness 70 Shore A, supplied assembled to the base.

GROUND MOUNTING
By means of two holes at 180°, supplied covered by a diaphragm (which can be easily removed by a metal tool), to avoid all unhealthy deposits of dirt and dust when the ground mounting is not required (see Fig. 1).

FEATURES
The special knurling under the lower lip of the base provides excellent stability and grip when using the levelling element without no-slip disk even on surfaces that are not perfectly flat.
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disk on page 1223).

ORDER INFORMATION
The levelling elements are supplied unassembled to make carriage and storage easier. The components (base and stem) are supplied in separate packing: less volume taken and better protection from scratches and dirt.
To order bases and stems separately, see:
table of the possible combinations Bases/Stems on page 1229.

ACCESSORIES ON REQUEST
Zinc-plated steel nut (see Nuts NT. on page 1223).

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

Data with no-slip disk mounted.

LV.F-SST

Levelling elements for ground mounting

Technopolymer base, stainless steel stem

BASE
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ARTICULATED STEM
Threaded AISI 304 stainless steel with regulation hexagon.

STANDARD EXECUTIONS
- **LV.F-SST**: without no-slip disk.
- **LV.F-AS-SST:** with NBR rubber no-slip disk, hardness 70 Shore A, supplied assembled to the base.

GROUND MOUNTING
By means of two holes at 180°, supplied covered by a diaphragm (which can be easily removed by a metal tool), to avoid all unhealthy deposits of dirt and dust when the ground mounting is not required (see Fig. 1).

FEATURES
The special knurling under the lower lip of the base provides excellent stability and grip when using the levelling element without no-slip disk even on surfaces that are not perfectly flat.
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disk on page 1223).

ORDER INFORMATION
The levelling elements are supplied unassembled to make carriage and storage easier. The components (base and stem) are supplied in separate packing: less volume taken and better protection from scratches and dirt.
To order bases and stems separately, see:
table of the possible combinations Bases/Stems on page 1229.

ACCESSORIES ON REQUEST
AISI 304 stainless steel nut (see Nuts NT. on page 1223).

ELESA Original design

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

Data with no-slip disk mounted.

Levelling elements for ground mounting

Technopolymer base, stainless steel stem

BASE
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ARTICULATED STEM
Threaded AISI 304 stainless steel with adjusting square.

STANDARD EXECUTIONS
- **LVQ.F-SST**: without no-slip disk.
- **LVQ.F-AS-SST:** with NBR rubber no-slip disk, hardness 70 Shore A, supplied assembled to the base.

GROUND MOUNTING
By means of two holes at 180°, supplied covered by a diaphragm (which can be easily removed by a metal tool), to avoid all unhealthy deposits of dirt and dust when the ground mounting is not required (see Fig. 1).

FEATURES
The special knurling under the lower lip of the base provides excellent stability and grip when using the levelling element without no-slip disk even on surfaces that are not perfectly flat.
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disk on page 1223).

ORDER INFORMATION
The levelling elements are supplied unassembled to make carriage and storage easier. The components (base and stem) are supplied in separate packing: less volume taken and better protection from scratches and dirt.
To order bases and stems separately, see:
table of the possible combinations Bases/Stems on page 1229.

ACCESSORIES ON REQUEST
AISI 304 stainless steel nut (see Nuts NT. on page 1223).

Data with no-slip disk mounted.

Levelling elements for ground mounting

Technopolymer base, steel or stainless steel stem

BASE

Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

STANDARD EXECUTIONS

Zinc-plated steel threaded and articulated stem with regulation hexagon:

- **LV.FO**: base without no-slip disk.
- **LV.FO-AS**: base with NBR rubber no-slip disk, hardness 70 Shore A, supplied assembled to the base.

AISI 304 stainless steel articulated and threaded stem with regulation hexagon:

- **LV.FO-SST**: base without no-slip disk.
- **LV.FO-AS-SST**: base with NBR rubber no-slip disk, hardness 70 Shore A, supplied assembled to the base.

GROUND MOUNTING

By means of two holes, supplied covered by a diaphragm (which can be easily removed by a metal tool), to avoid all unhealthy deposits of dirt and dust when only one hole is used (see Fig. 1).

FEATURES

The special knurling under the lower lip of the base provides excellent stability and grip when using the levelling element without no-slip disk even on surfaces that are not perfectly flat.
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disks on page 1223).

ORDER INFORMATION

The levelling elements are supplied unassembled to make carriage and storage easier. The components (base and stem) are supplied in separate packing: less volume taken and better protection from scratches and dirt.
To order bases and stems separately, see:
table of the possible combinations Bases/Stems on page 1229.

ACCESSORIES ON REQUEST

AISI 304 stainless steel or zinc-plated steel nut (see Nuts NT. on page 1223).

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

Data with no-slip disk mounted.

LVQ.FO-SST

INOX STAINLESS STEEL | RoHS | PA | NBR | +100° -30°

Levelling elements for ground mounting

Technopolymer base, stainless steel stem

BASE
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

STANDARD EXECUTIONS
AISI 304 stainless steel articulated and threaded stem with adjusting square.
- **LVQ.FO-SST**: base without no-slip disk.
- **LVQ.FO-AS-SST**: base with NBR rubber no-slip disk, hardness 70 Shore A, supplied assembled to the base.

GROUND MOUNTING
By means of two holes, supplied covered by a diaphragm (which can be easily removed by a metal tool), to avoid all unhealthy deposits of dirt and dust when only one hole is used (see Fig. 1).

FEATURES
The special knurling under the lower lip of the base provides excellent stability and grip when using the levelling element without no-slip disk even on surfaces that are not perfectly flat.
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disks on page 1223).

ORDER INFORMATION
The levelling elements are supplied unassembled to make carriage and storage easier. The components (base and stem) are supplied in separate packing: less volume taken and better protection from scratches and dirt.
To order bases and stems separately, see:
table of the possible combinations Bases/Stems on page 1229.

ACCESSORIES ON REQUEST
AISI 304 stainless steel nut (see Nuts NT. on page 1223).

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

Data with no-slip disk mounted.

LV.A-125-ACV

RoHS PA NBR +100° -30°

Levelling elements

Technopolymer base, steel stem

BASE
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ARTICULATED THROUGH STEM
Threaded zinc-plated steel with regulation hexagon.
Assembled to the base by means of zinc-plated steel set screw and washer.

CUP WASHER FOR STEM BEARING
Glossy zinc-plated steel.

STANDARD EXECUTIONS
- **LV.A-ACV**: without no-slip disk.
- **LV.A-ACV-AS**: with NBR rubber no-slip disk, hardness 90 Shore A, supplied assembled with reinforced zinc-plated steel plate fixed by means of two screws.

FEATURES
The special knurling under the lower lip of the base provides excellent stability and grip when using the levelling element without no-slip disk even on surfaces that are not perfectly flat.
The components of the levelling elements (base and stem) are supplied already assembled.

ACCESSORIES ON REQUEST
Zinc-plated steel nut (see Nuts NT. on page 1223).

SPECIAL EXECUTIONS ON REQUEST
AISI 304 stainless steel stems.

LV.A-ELK

RoHS PA NBR +100° -30°

Levelling elements

Technopolymer base and knob, steel stem

ELESA Original design

BASE
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ARTICULATED STEM AND BUILT-IN REGULATION KNOB
Threaded zinc-plated steel stem. Regulation knob in technopolymer type ELK.
Black-oxide steel washer and retaining screw (M4x10).

STANDARD EXECUTIONS
- **LV.A-ELK**: without no-slip disk.
- **LV.A-AS-ELK**: with NBR rubber no-slip disk, hardness 70 Shore A, supplied assembled to the base.

FEATURES
The special knurling under the lower lip of the base provides excellent stability and grip when using the levelling element without no-slip disk even on surfaces that are not perfectly flat.
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disk on page 1223).
ELK. built-in regulation knob enables the operator to adjust manually the stem without the use of tools.
The components of the levelling elements (base and stem) are supplied already assembled.

NOTE
The threaded stem with built-in knob SM-14-M16x78-ELK (code 302581) can be assembled on other bases with hole for articulation with diameter 14.

ACCESSORIES ON REQUEST
Zinc-plated steel nut (see Nuts NT. on page 1223).

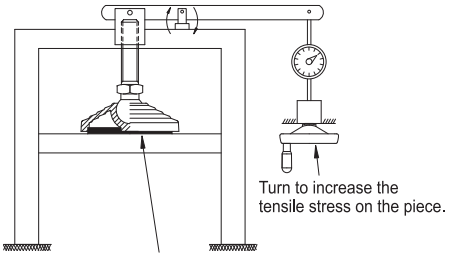
No-slip disks for levelling elements

It is extremely important that the no-slip disk must not detach from the base of the levelling element.
There are typical situations in which the conditions for the detachment of the no-slip disk could take place:
- case of eventual "sticking" of the no-slip disk to the floor while lifting the machinery for moving;
- case of side impacts against the levelling element with the no-slip disk during machinery transport.

The assembling system created by Elesa+Ganter consists of an anchoring in the central part of the disk, besides a particular slot along the whole rim profile.
Tests of separation, carried out in our labs with suitable equipment simulating real conditions (Fig. 1 and Fig. 2), have given the following results, compared with the current anchoring systems:
- detachment resistance in cases of adhesion (sticking) of the no-slip disk to the floor: fourfold increased;
- detachment resistance in case of side impacts: tenfold increased.

The no-slip disks are supplied assembled to their plastic bases.



No-slip disk glued to the plate of the testing device

Fig.1
Test of no-slip disk separation with a no-slip disk "stuck" to the floor (case of machinery lifting for moving to another location)

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.
# Data with no-slip disk mounted.

Levelling element bases

ESD conductive technopolymer

MATERIAL

Glass-fibre reinforced polyamide based (PA) special conductive technopolymer, black colour, matte finish.
Surface resistivity = 10^3 Ω (ASTM D257 measuring method).
Volume resistivity = 10^3 Ωcm (ASTM D257 measuring method).

BASES WITHOUT NO-SLIP DISK

- **LV.A-ESD-C**: without ground mounting.
- **LV.F-ESD-C**: with two holes at 180° for ground mounting, supplied covered by a breakable plastic diaphragm (which can be easily removed by a metal tool) to avoid all unhealthy deposits of dirt and dust when the ground mounting is not required (see Fig.1).

BASES WITHOUT NO-SLIP DISK

NBR rubber no-slip disk, hardness 70 Shore A, supplied assembled to the base.
Surface resistivity = 10^3 Ω (ASTM D991 measuring method).
Volume resistivity = 10^3 Ωcm (ASTM D991 measuring method).
The particular assembling system of the no-slip disk to the base assures a perfect anchoring, preventing separation even in case of impact during transport or of adhesion (sticking) to the floor (see No-slip disks on page 1223).

- **LV.A-AS-ESD-C**: without ground mounting.
- **LV.F-AS-ESD-C**: with two holes at 180° for ground mounting, supplied covered by a breakable plastic diaphragm (which can be easily removed by a metal tool) to avoid all unhealthy deposits of dirt and dust when the ground mounting is not required (see Fig.1).

NOTE

To choose the stem see:
tables of the possible combinations Bases/Stems on page 1229.

ELESA Original design

FEATURES AND APPLICATIONS

The special conductive technopolymer (ESD-C Electrostatic Discharge Conductive) prevents the accumulation of electrostatic charge.
The bases are suitable for "ESD PROTECTED AREA" (EPA) where components, which are susceptible to electrostatic discharges, are handled.
The (ESD-C) indelibly printed mark on the surface of the levelling elements bases identifies the particular conductive features of the material according to EN 100015/1 and IEC 61340-5-1.
The special knurling under the lower lip of the base provides excellent stability and grip when using the levelling element without no-slip disk even on surfaces that are not perfectly flat.

Stems for levelling elements

Steel or stainless steel

STANDARD EXECUTIONS

- **SM**: zinc-plated steel spheric articulated and threaded stem with regulation hexagon.
- **SM-SST**: AISI 304 stainless steel spheric articulated and threaded stem with regulation hexagon.

NOTE

To choose the base see:
table of the possible combinations Bases/Stems on page 1229.
The stems are usually supplied in a packing of four pieces compacted by means of a shrink film to avoid any damaging movement during transport.
For big quantities, the stems are supplied in wooden boxes and are placed in order, to avoid any damaging movement during transport.

Levelling feet

Steel sheet metal, zinc plated / with rubber underlay

SPECIFICATION

Types (Base plate)

- Type **A1**: Steel, zinc plated, rubber inlaid, black
- Type **A2**: Steel, zinc plated, rubber inlaid, white

Version

- Version **S**: without nut, external hexagon at the bottom
- Version **SK**: with nut, external hexagon at the bottom
- Version **U**: without nut, hexagon socket at the top, wrench flat at the bottom
- Version **UK**: with nut, hexagon socket at the top, wrench flat at the bottom
- Version **X**: with female thread, external hexagon

Base plate, sheet metal
Steel, zinc plated, blue passivated

Threaded stem
Steel, zinc plated, blue passivated

Hexagon nut ISO 4032
Steel, zinc plated, blue passivated

Rubber underlay, inlaid

- black: Perbunan® (NBR) 80±5 Shore A
- white: Santoprene® (TPE) 80±5 Shore A

INFORMATION

Levelling feet GN 30 will be delivered mounted and are not removable.

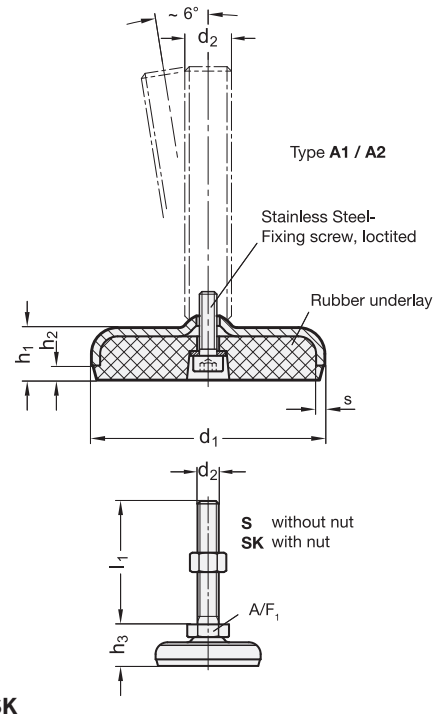
TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)

LOAD RATING OF LEVELLING FEET

Information

The static load bearing capacity given in the table rests on a test series in which the load has been applied perpendicular to the base plate. For the values given in the table, the strain relief may result in minor deformations of the base plate.
Bending and buckling stress which often occurs in practice results in a lower load bearing capacity of the adjustment spindle and may have to be taken into account.
Also, the spindle strength is assumed to be ≥ 500 N/mm^2.
The details given on strength are nonbinding guide values without any liability. In general, they do not constitute a warranty of quality.
The user must determine from case to case if a product is suitable for the intended purpose or use. Environmental factors may influence the stated values.



*Complete with version of the Levelling feet (External hexagon at the bottom)

Stainless Steel-Levelling fe

with rubber underlay

SPECIFICATION

Types (Base plate)

- Type **B1**: matt shot-blasted, rubber inlaid, black
- Type **B2**: matt shot-blasted, rubber inlaid, white
- Type **B3**: matt shot-blasted, rubber vulcanised, black
- Type **B4**: matt shot-blasted, rubber vulcanised, white
- Type **C3**: polished, rubber vulcanised, black
- Type **C4**: polished, rubber vulcanised, white

Version

- Version **S**: without nut, external hexagon at the bottom
- Version **SK**: with nut, external hexagon at the bottom
- Version **T**: without nut, wrench flat at the bottom
- Version **TK**: with nut, wrench flat at the bottom
- Version **U**: without nut, hexagon socket at the top, wrench flat at the bottom
- Version **UK**: with nut, hexagon at the top, wrench flat at the bottom
- Version **V**: without nut, external hexagon at the top, wrench flat at the bottom
- Version **VK**: with nut, external hexagon socket at the top, wrench flat at the bottom
- Version **W**: with adjustable sleeve, covered thread, wrench flat at the bottom
- Version **X**: with female thread, external hexagon

Base plate, blank ground
Stainless Steel AISI 304

Threaded stem
Stainless Steel AISI 303

Hexagon nut ISO 4032
Stainless Steel AISI 304

Rubber underlay, inlaid
- black: Perbunan® (NBR) 80±5 Shore A
- white: Perbunan® (CTP) 80±5 Shore A

Rubber underlay, vulcanised
- black: Perbunan® (NBR) 80±5 Shore A
- white: Perbunan® (NBR) 80±5 Shore A

INFORMATION

GN 31 Stainless Steel-Levelling feet with vulcanised rubber (Type B3, B4, C3 and C4) and screw version W feature fewer dead spots owing to their construction method and are also easier to clean.

Stainless Steel-Levelling feet GN 31 will be delivered mounted and are not removable.

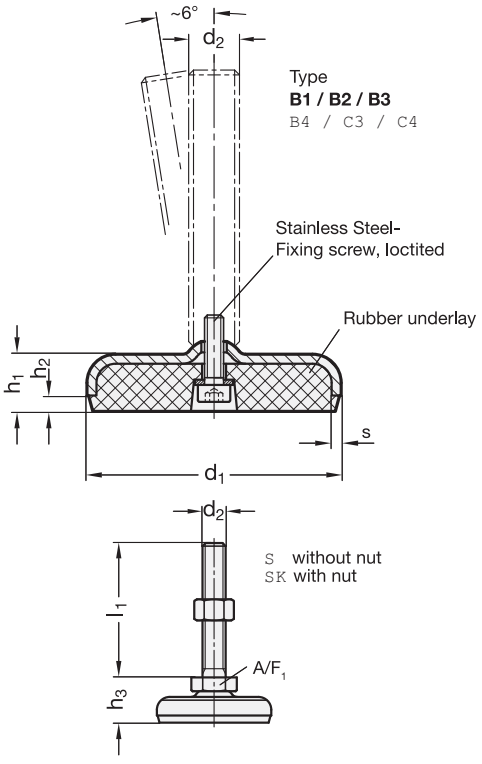
TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Elastomer characteristics (see page A32)

LOAD RATING OF STAINLESS STEEL-LEVELLING FEET

Information

The static load bearing capacity given in the table rests on a test series in which the load has been applied perpendicular to the base plate (without rubber underlay). For the values given in the table, the strain relief may result in minor deformations of the base plate.
Bending and buckling stress which often occurs in practice results in a lower load bearing capacity of the adjustment spindle and may have to be taken into account.
Also, the spindle strength is assumed to be ≥ 500 N/mm².
The details given on strength are nonbinding guide values without any liability. In general, they do not constitute a warranty of quality.
The user must determine from case to case if a product is suitable for the intended purpose or use. Environmental factors may influence the stated values.



*Complete with version of the Levelling feet (External hexagon at the bottom)

Levelling feet

Requirements , design principles

DESIGN REQUIREMENTS FOR HYGIENIC DESIGN

Material

- Non-rusting Stainless Steels
- FDA and EU compliant plastics and elastomers

Surfaces

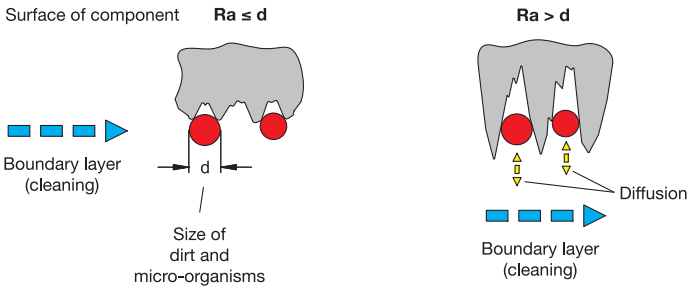
- Surfaces must be able to be cleaned
- Steps due to appliance configurations which are not aligned must be avoided
- Seals must be designed so that no gaps occur
- O-ring grooves must be hygienically designed
- Contact with the product to be manufactured must be ruled out
- Corners should preferably have a radius of 6 mm or more

Design / Geometry

The interior and exterior areas of all appliances, components or piping must be self-draining or be able to be drained and easy to clean.

Surface properties and roughness

Easy to clean with Ra < 0.8 µm



DESIGN PRINCIPLES FOR HYGIENIC DESIGN

EHEDG

- European Hygienic Engineering & Design Group
- non-profit European consortium of machine and food manufacturers
- as well their suppliers, research institutes, universities and government health agencies
- approximately 45 guidelines
- examination of products and issue of certificates

3-A Sanitary Standard, Inc.

- non profit and independent association in the USA
- three interest groups:
  public and governmental health agencies, machine and food manufacturers
- over 70 Sanitary Standards
- examination of designs and processes, issue of certificates

88-00

LEGAL BASIS OF HYGIENIC DESIGN

EN 1672-2:2009 “Food machinery”

Machines must be able to be cleaned, i.e. they must be designed and constructed so that dirt can be removed with the recommended cleaning methods.

Machinery directive 2006/42/EC

Machines must be designed so that
- materials can be easily and fully cleaned before each use and
- no risk of infections or illness is created.

DIN EN ISO 14519:2008-07

Hygiene requirements for the design of machines

DIN EN 1672:2009-07

Food machinery – General design principles – Part 2

Levelling feet

Mounting example, certification

SEALS

For the standard parts which are listed in Hygienic Design, seals have the central function of protecting dead spaces, gaps and cracks from the penetration of cleaning fluids or product residues.

For this, a defined pre-tension or pressing of the seals and wipers is necessary for a reliable and permanent seal in the installed condition. Within the Hygienic Design product family, seal installation spaces and seal cross sections are calculated and designed with simulation software, so that the necessary surface compression is achieved on installation and the seal material is not subjected to excess pressure.

A fundamental differentiation can be made between static and moving seals:

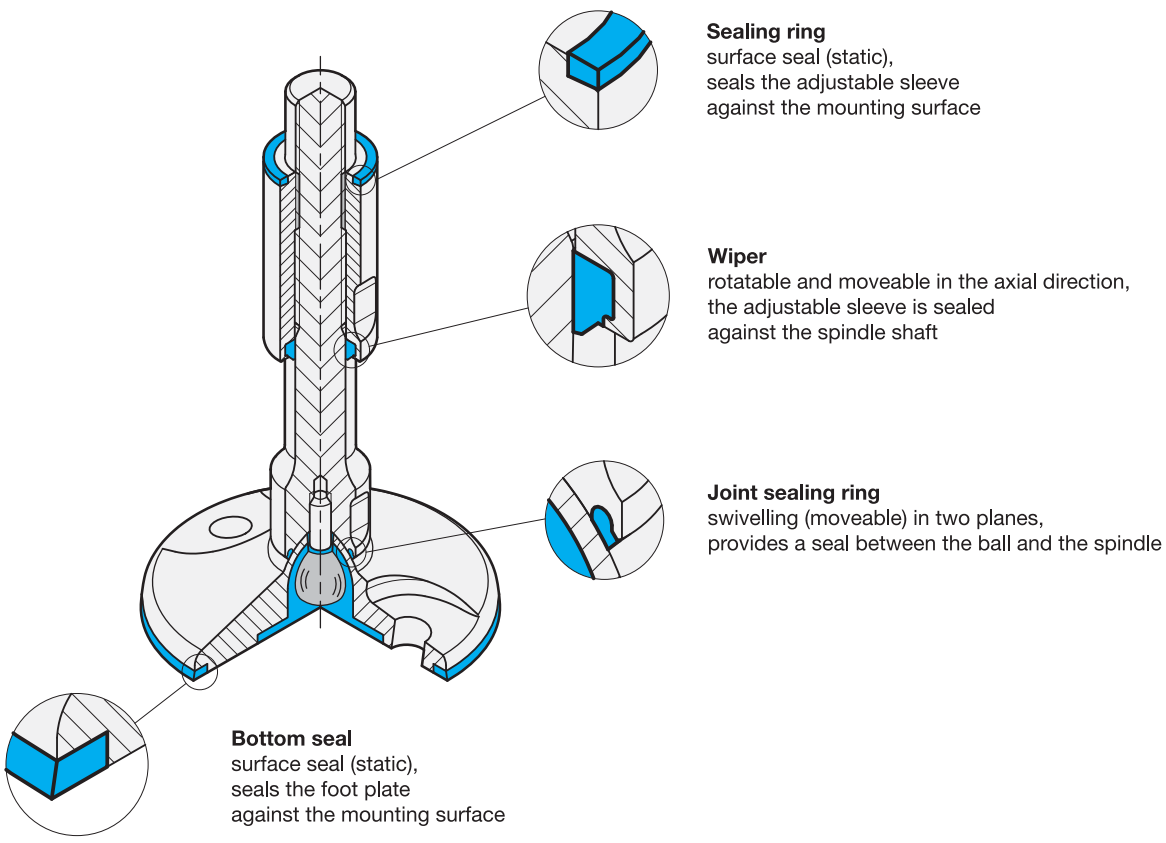
During assembly, the static seals in the design example shown below are tightened to the mounting surface at the top (sealing ring) and to the contact surface at the bottom (bottom seal). It should be ensured that all surfaces which make contact with the seal have a surface finish of al least R_a 0.8 µm.

The moving seals on the adjustable sleeve (wiper) and the ball joint (joint sealing ring) of the foot are designed so that they allow adjustment in both height and angle. With these too, the installation space together with the cross section of the seal ensures a gap-free, pre-tensioned seal.

Depending on the version and the type of use, it may be the case that seals may need to be replaced in case of damage or for preventative maintenance. For this, Elesa and Ganter supplies the relevant seals as spare parts or offers these under GN 7600 (see www.elesa-ganter.com) as standard parts.

DESIGN OF THE LEVELLING FEET GN 20

The illustrated design of the GN 20 Hygienic Design levelling feet shows how the various seal configurations are arranged.



Sealing ring
surface seal (static),
seals the adjustable sleeve
against the mounting surface

Wiper
rotatable and moveable in the axial direction,
the adjustable sleeve is sealed
against the spindle shaft

Joint sealing ring
swivelling (moveable) in two planes,
provides a seal between the ball and the spindle

Bottom seal
surface seal (static),
seals the foot plate
against the mounting surface

Levelling feet

Hygienic Design, with and without mounting holes

SPECIFICATION

Types

- Type **A**: without mounting holes
- Type **B**: with mounting holes

Spindle, adjustable sleeve, foot plate

- Stainless Steel AISI 304
- turned

Seals, blue, FDA compliant

Sealing ring
NBR, hardness 70 ±5 Shore A

Wiper
TPU, hardness 95 ±5 Shore A

Joint sealing ring
H-NBR, hardness 85 ±5 Shore A

Bottom seal
Silicon, hardness 85 ±5 Shore A

INFORMATION

GN 20 hygienic levelling feet are certified according to 3-A Sanitary Standard, Inc. guidelines and are intended for use in hygiene areas. In addition, the version with mounting holes (type B) is certified according to EHEDG guidelines.
The bottom seal protects the area beneath the foot plate from dirt. For this, the foot must be screwed on using the mounting holes and compressed accordingly. Hygienic fastenings and the correct position of the mounting holes are essential. The sealing ring above the adjustment sleeve enables fastening without dead space. Due to the wiper or the ball seal, the moving components are sealed against the environment.
The high quality finish prevents adherence of dirt and facilitates cleaning.
The values listed in the table for static load capacity refer to a purely vertical load in relation to the leveling foot. Under normal operating conditions bending loads or angular loads are not uncommon and result in a reduction of load capacity, which must be taken into consideration.

Stainless Steel-Levelling feet

with turned base plate, without mounting bore

SPECIFICATION

Types (Base plate)

- Type **DO**: fine turned, without rubber underlay
- Type **D1**: fine turned, with rubber underlay, inlaid, black

Versions of threaded stem

- Version **S**: without nut, external hexagon at the bottom
- Version **SK**: with nut, external hexagon at the bottom
- Version **T**: without nut, wrench flat at the bottom, "not dipping" version
- Version **TK**: with nut, wrench flat at the bottom, "not dipping" version
- Version **U**: without nut, hexagon socket at the top, wrench flat at the bottom
- Version **UK**: with nut, hexagon socket at the top, wrench flat at the bottom
- Version **V**: without nut, external hexagon at the top, wrench flat at the bottom
- Version **VK**: with nut, external hexagon at the top, wrench flat at the bottom
- Version **W**: with adjustable sleeve, hygienic version, wrench flat at the bottom
- Version **X**: with female thread, external hexagon

Base plate
Stainless Steel AISI 304

Threaded stem
Stainless Steel AISI 303

Hexagon nut ISO 4032
Stainless Steel AISI 304

Rubber underlay, inlaid
Perbunan® (NBR), 70 Shore A

INFORMATION

Stainless Steel-Levelling feet GN 21 will be delivered mounted and are not removable.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Elastomer characteristics (see page A32)

LOAD RATING OF STAINLESS STEEL-LEVELLING FEET

At a spindle thread size M 10 and higher, the static load of the Stainless Steel-Levelling feet GN 21 is limited owing to the permissible contact pressure of the adjustment spindle acting on the base plate (at a spindle strength ≥ 500 N/mm^2). The values given in the table (valid for type D0 without rubber underlay) assume a clean pressure load perpendicular to the base plate. Bending and buckling stress which often occurs in practice results in a lower load-bearing capacity of the adjustment spindle and may have to be taken into account.
The details given on strength are non-binding guide values without any liability. In general, they do not constitute a warranty or quality. The user must determine from case to case if a product is suitable for the intended purpose or use. Environmental factors may influence the stated values.

Stainless Steel-Levelling feet

with turned base plated, with mounting holes

SPECIFICATION

Types (Base plate)

- Type **D0**: fine turned, without rubber underlay
- Type **D1**: fine turned, with rubber underlay, inlaid, black

Version of threaded stem

- Version **S**: without nut, external hexagon at the bottom
- Version **SK**: with nut, external hexagon at the bottom
- Version **T**: without nut, wrench flat at the bottom, "not dipping" version
- Version **TK**: with nut, wrench flat at the bottom, "not dipping" version
- Version **U**: without nut, hexagon socket at the top, wrench flat at the bottom
- Version **UK**: with nut, hexagon socket at the top, wrench flat at the bottom
- Version **V**: without nut, external hexagon at the top, wrench flat at the bottom
- Version **VK**: with nut, external hexagon at the top, wrench flat at the bottom
- Version **W**: with adjustable sleeve, Hygienic Version, wrench flat at the bottom
- Version **X**: with female thread, external hexagon

Base plate
Stainless Steel AISI 304

Threaded stem
Stainless Steel AISI 303

Hexagon nut ISO 4032
Stainless Steel AISI 304

Rubber underlay, inlaid
Perbunan® (NBR), 70 Shore A

INFORMATION

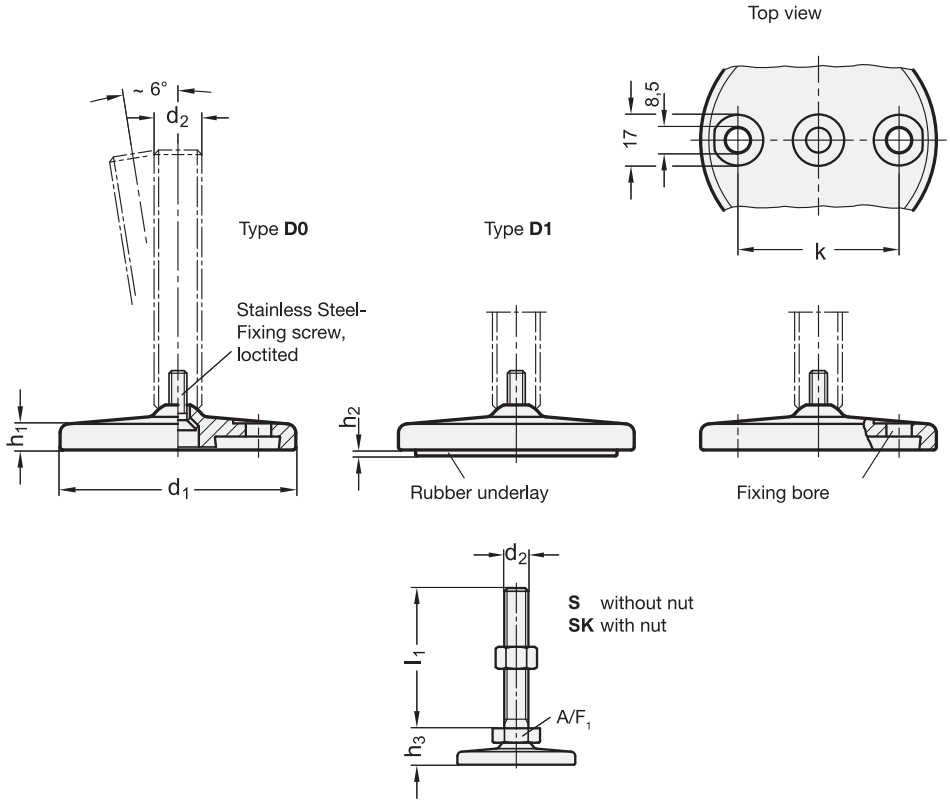
Stainless Steel-Levelling feet GN 23 will be delivered mounted and are not removable.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Elastomer characteristics (see page A32)

LOAD RATING OF STAINLESS STEEL-LEVELLING FEET

At a spindle thread size M 10 and higher, the static load of the Stainless Steel-Levelling feet GN 23 is limited owing to the permissible contact pressure of the adjustment spindle acting on the base plate (at a spindle strength ≥ 500 N/mm^2). The values given in the table (valid for type D0 without rubber underlay) assume a clean pressure load perpendicular to the base plate. Bending and buckling stress which often occurs in practice results in a lower load-bearing capacity of the adjustment spindle and may have to be taken into account.
The details given on strength are non-binding guide values without any liability. In general, they do not constitute a warranty of quality.
The user must determine from case to case if a product is suitable for the intended purpose or use. Environmental factors may influence the stated values.



*Complete with version of the Stainless Steel-Levelling feet (External hexagon at the bottom)

Levelling feet

Steel sheet metal, zinc plated / with fixing lug

SPECIFICATION

Type (Base plate)
- Type **A1**: Steel, zinc plated, rubber, inlaid black

Version
- Version **S**: without nut, external hexagon at the bottom
- Version **SK**: with nut, external hexagon at the bottom
- Version **U**: without nut, internal hexagon socket at the top, wrench flat at the bottom
- Version **UK**: with nut, internal hexagon socket at the top, wrench flat at the bottom
- Version **X**: with female thread, external hexagon

Base plate / lug, sheet metal
Steel, zinc plated, blue passivated

Threaded stem
Steel, zinc plated, blue passivated

Hexagon nut ISO 4032
Steel, zinc plated, blue passivated

Rubber underlay, inlaid
black, Perbunan® (NBR) 80±5 Shore A

INFORMATION

Levelling feet GN 32 will be delivered mounted and are not removable.

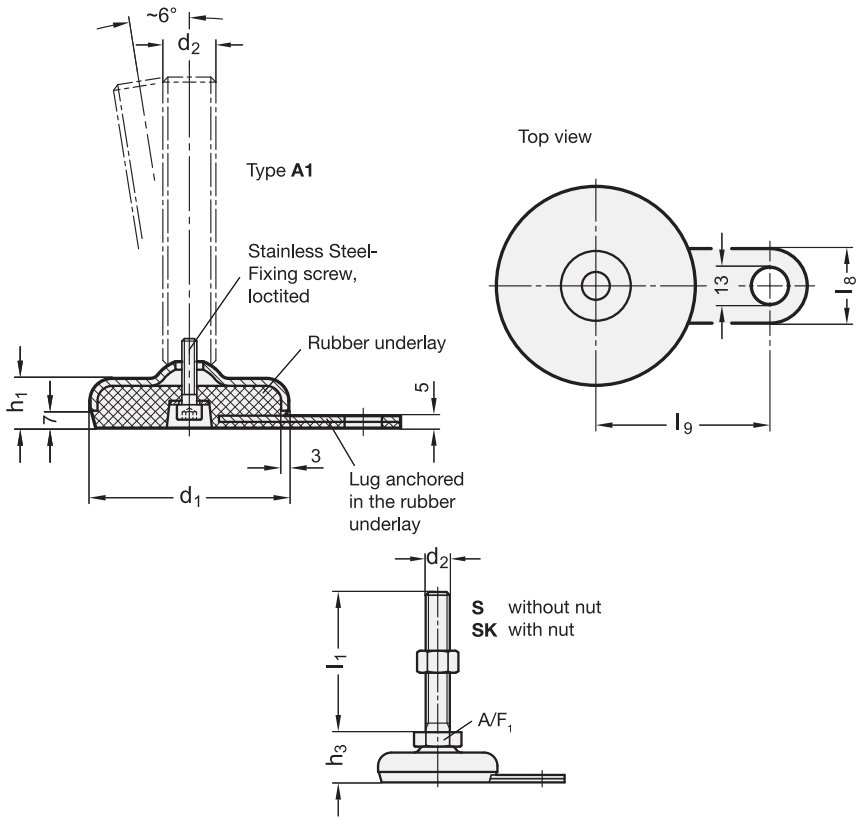
TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)

LOAD RATING OF LEVELLING FEET

Information

The static load bearing capacity given in the table rests on a test series in which the load has been applied perpendicular to the base plate. For the values given in the table, the strain relief may result in minor deformations of the base plate.
Bending and buckling stress which often occurs in practice results in a lower load bearing capacity of the adjustment spindle and may have to be taken into account.
Also, the spindle strength is assumed to be ≥ 500 N/mm^2.
The details given on strength are nonbinding guide values without any liability. In general, they do not constitute a warranty of quality.
The user must determine from case to case if a product is suitable for the intended purpose or use. Environmental factors may influence the stated values.



*Complete with version of the Levelling feet (External hexagon at the bottom)

S without nut

SK with nut

Stainless Steel-Levelling feet

with fixing lug

SPECIFICATION

Type (Base plate)

- Type **B1**: matt shot-blasted, rubber inlaid, black

Version of threaded stem

- Version **S**: without nut, external hexagon at the bottom
- Version **SK**: with nut, external hexagon at the bottom
- Version **T**: without nut, wrench flat at the bottom, "not dipping" version
- Version **TK**: with nut, wrench flat at the bottom, "not dipping" version
- Version **U**: without nut, hexagon socket at the top, wrench flat at the bottom
- Version **UK**: with nut, hexagon socket at the top, wrench flat at the bottom
- Version **V**: without nut, external hexagon at the top, wrench flat at the bottom
- Version **VK**: with nut, external hexagon at the top, wrench flat at the bottom
- Version **W**: with adjustable sleeve, wrench flat at the bottom
- Version **X**: with female thread, external hexagon

Base plate / lug, sheet metal
Stainless Steel AISI 304

Threaded stem
Stainless Steel AISI 303

Hexagon nut ISO 4032
Stainless Steel AISI 304

Rubber underlay, inlaid
black, Perbunan® (NBR) 80±5 Shore A

INFORMATION

Stainless Steel-Levelling feet GN 33 will be delivered mounted and are not removable.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Elastomer characteristics (see page A32)

LOAD RATING OF STAINLESS STEEL-LEVELLING FEET

Information

The static load bearing capacity given in the table rests on a test series in which the load has been applied perpendicular to the base plate. For the values given in the table, the strain relief may result in minor deformations of the base plate.
Bending and buckling stress which often occurs in practice results in a lower load bearing capacity of the adjustment spindle and may have to be taken into account.
Also, the spindle strength is assumed to be ≥ 500 N/mm^2.
The details given on strength are nonbinding guide values without any liability. In general, they do not constitute a warranty of quality.
The user must determine from case to case if a product is suitable for the intended purpose or use. Environmental factors may influence the stated values.

Levelling feet

Steel zinc plated, without fixing lug

SPECIFICATION

Types (Base plate)

- Type **A0**: Steel, zinc plated, without rubber underlay
- Type **A1**: Steel, zinc plated, rubber clipped on, black
- Type **B0**: without rubber underlay, with 2 fixing holes
- Type **A3**: Stainless Steel, blank, rubber vulcanised, black

Version

- Version **S**: without nut, external hexagon at the bottom
- Version **SK**: with nut, external hexagon at the bottom
- Version **U**: without nut, hexagon socket at the top, wrench flat at the bottom
- Version **UK**: with nut, with hexagon socket at the top, wrench flat at the bottom
- Version **X**: with female thread, external hexagon

Base plate

- Type B0 / A0 / A1: Steel, zinc plated
- Type A3: Stainless Steel AISI 303

Threaded stem
Steel, zinc plated, blue passivated

Hexagon nut ISO 4032
Steel, zinc plated, blue passivated

Rubber cap, clipped on
black, Santoprene® (TPE) 80 ≈ Shore A

Rubber underlay, vulcanised
black, Perbunan® (NBR) 70 ± Shore A

INFORMATION

Levelling feet GN 40 are easy and very reasonably priced foot design variants.
They will be delivered mounted and are not removable.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Elastomer characteristics (see page A32)

LOAD RATING OF LEVELLING FEET

Information

The static load bearing capacity given in the table rests on a test series in which the load has been applied perpendicular to the base plate (without rubber underlay). For the values given in the table, the strain relief may result in minor deformations of the base plate.
Bending and buckling stress which often occurs in practice results in a lower load bearing capacity of the adjustment spindle and may have to be taken into account.
Also, the spindle strength is assumed to be ≥ 500 N/mm^2.
The details given on strength are nonbinding guide values without any liability. In general, they do not constitute a warranty of quality.
The user must determine from case to case if a product is suitable for the intended purpose or use. Environmental factors may influence the stated values.

Weight Version U

Stainless Steel-Levelling feet

without fixing lug

SPECIFICATION

Types (Base plate)

- Type **BO**: without rubber underlay, with 2 fixing bores
- Type **DO**: without rubber underlay
- Type **D1**: rubber clipped on, black
- Type **D3**: rubber vulcanised, black

Version

- Version **S**: without nut, External hexagon at the bottom
- Version **SK**: with nut, External hexagon at the bottom
- Version **T**: without nut, Wrench flat at the bottom, "not dipping" version
- Version **TK**: with nut, Wrench flat at the bottom, "not dipping" version
- Version **U**: without nut, Hexagon socket at the top, Wrench flat at the bottom
- Version **UK**: with nut,Hexagon socket at the top, Wrench flat at the bottom
- Version **V**: without nut, External hexagon at the top, Wrench flat at the bottom
- Version **VK**: with nut, External hexagon at the top, Wrench flat at the bottom
- Version **W**: with adjustable sleeve, Wrench flat at the bottom
- Version **X**: with female thread, External hexagon

Base plate, blank ground
Stainless Steel AISI 304

Threaded stem
Stainless Steel AISI 303

Hexagon nut ISO 4032
Stainless Steel AISI 304

Rubber cap, clipped on
black, Santoprene® (TPE) 80 ≈ Shore A

Rubber underlay, vulcanised
black, Perbunan® (NBR) 70 ± Shore A

INFORMATION

Stainless Steel-Levelling feet GN 41 are easy and very reasonably priced foot design variants.
They will be delivered mounted and are not removable.

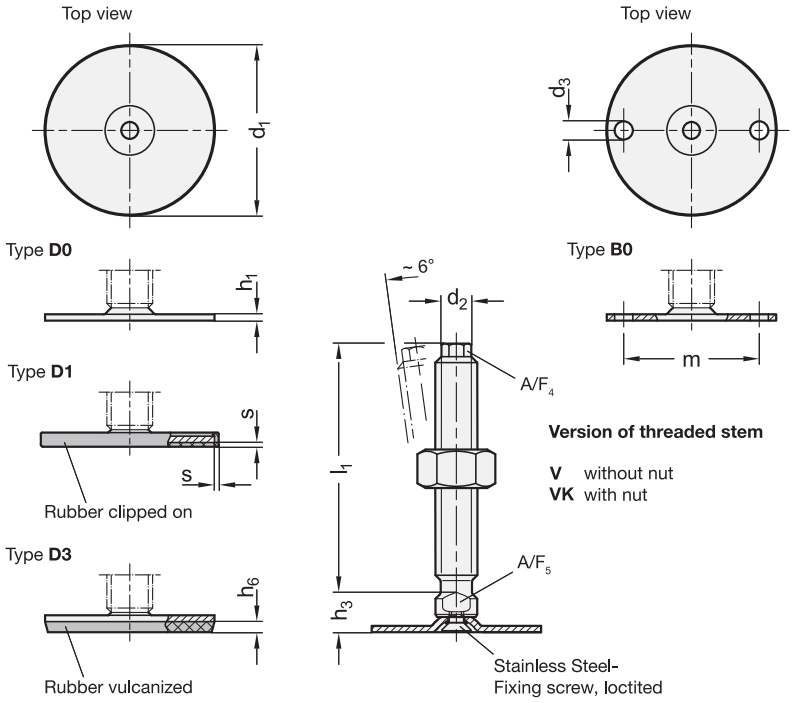
TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Elastomer characteristics (see page A32)

LOAD RATING OF STAINLESS STEEL-LEVELLING FEET

Information

The static load bearing capacity given in the table rests on a test series in which the load has been applied perpendicular to the base plate (without rubber underlay). For the values given in the table, the strain relief may result in minor deformations of the base plate.
Bending and buckling stress which often occurs in practice results in a lower load bearing capacity of the adjustment spindle and may have to be taken into account.
Also, the spindle strength is assumed to be ≥ 500 N/mm^2.
The details given on strength are nonbinding guide values without any liability. In general, they do not constitute a warranty of quality.
The user must determine from case to case if a product is suitable for the intended purpose or use. Environmental factors may influence the stated values.



*Complete with version of Levelling feet (External hexagon socket on the top/Wrench flat at the bottom)

GN 42

Levelling feet

Steel, zinc plated, with fixing lug

SPECIFICATION

Types (Base plate)

- Type **A0**: Steel, zinc plated, without rubber underlay
- Type **A1**: Steel, zinc plated, rubber clipped on, black
- Type **A3**: Stainless Steel, blank, rubber vulcanised, black

Version of threaded stem

- Version **S**: without nut, external hexagon at the bottom
- Version **SK**: with nut, external hexagon at the bottom
- Version **U**: without nut, hexagon socket at the top, wrench flat at the bottom
- Version **UK**: hexagon socket at the top, wrench flat at the bottom
- Version **X**: with female thread, external hexagon

Base plate

- Type A0 / A1: Steel, zinc plated
- Type A3: Stainless Steel AISI 303

Threaded stem
Steel, zinc plated, blue passivated

Hexagon nut ISO 4032
Steel, zinc plated, blue passivated

Rubber cap, clipped on
black, Santoprene® (TPE) 80 ≈ Shore A

Rubber underlay, vulcanised
black, Perbunan® (NBR) 70 ± Shore A

INFORMATION

Levelling feet GN 42 will be delivered mounted and are not removable.

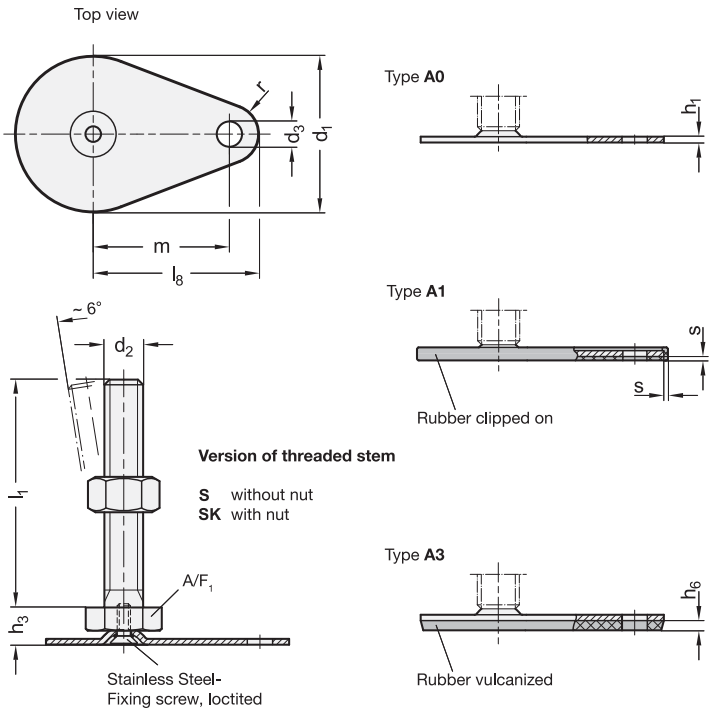
TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Elastomer characteristics (see page A32)

LOAD RATING OF LEVELLING FEET

Information

The static load bearing capacity given in the table rests on a test series in which the load has been applied perpendicular to the base plate (without rubber underlay). For the values given in the table, the strain relief may result in minor deformations of the base plate.
Bending and buckling stress which often occurs in practice results in a lower load bearing capacity of the adjustment spindle and may have to be taken into account.
Also, the spindle strength is assumed to be ≥ 500 N/mm^2.
The details given on strength are nonbinding guide values without any liability. In general, they do not constitute a warranty of quality.
The user must determine from case to case if a product is suitable for the intended purpose or use. Environmental factors may influence the stated values.



*Complete with version of the Levelling feet (External hexagon at the bottom)

Stainless Steel-Levelling feet

with fixing lug

SPECIFICATION

Types (Base plate)

- Type **D0**: blank, ground without rubber underlay
- Type **D1**: blank, ground rubber, clipped on, black
- Type **D3**: blank, ground rubber vulcanised, black

Version

- Version **S**: without nut, external hexagon at the bottom
- Version **SK**: with nut, external hexagon at the bottom
- Version **T**: without nut, wrench flat at the bottom, "not dipping" version
- Version **TK**: with nut, wrench flat at the bottom, "not dipping" version
- Version **U**: without nut, hexagon socket at the top, wrench flat at the bottom
- Version **UK**: with nut, hexagon socket at the top, wrench flat at the bottom
- Version **V**: without nut, external hexagon at the top, wrench flat at the bottom
- Version **VK**: with nut, external hexagon at the top, wrench flat at the bottom
- Version **W**: with adjustable sleeve, wrench flat at the bottom
- Version **X**: with female thread, external hexagon

Base plate
Stainless Steel AISI 304

Threaded stem
Stainless Steel AISI 303

Hexagon nut ISO 4032
Stainless Steel AISI 304

Rubber cap, clipped on
black, Santoprene® (TPE) 80 ≈ Shore A

Rubber underlay, vulcanised
black, Perbunan® (NBR) 70 ± Shore A

INFORMATION

Stainless Steel-Levelling feet GN 43 will be delivered mounted and are not removable.

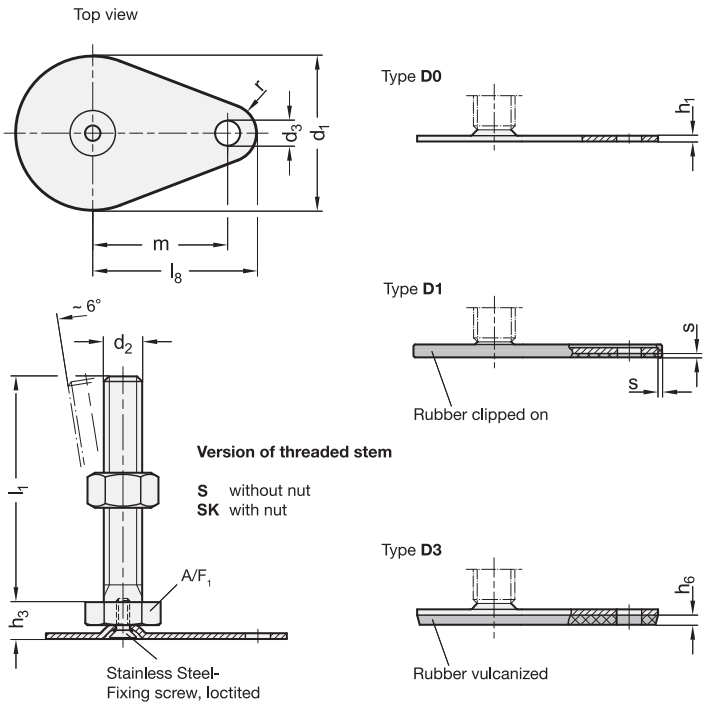
TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Elastomer characteristics (see page A32)

LOAD RATING OF STAINLESS STEEL-LEVELLING FEET

Information

The static load bearing capacity given in the table rests on a test series in which the load has been applied perpendicular to the base plate (without rubber underlay). For the values given in the table, the strain relief may result in minor deformations of the base plate.
Bending and buckling stress which oftenoccurs in practice results in a lower load bearing capacity of the adjustment spindle and may have to be taken into account.
Also, the spindle strength is assumed to be ≥ 500 N/mm^2.
The details given on strength are nonbinding guide values without any liability. In general, they do not constitute a warranty of quality.
The user must determine from case to case if a product is suitable for the intended purpose or use. Environmental factors may influence the stated values.



GN 43 | Stainless Steel-Levelling feet

*Complete with version of the Levelling feet (External hexagon at the bottom)

S
without nut

Vibration-damping levelling elements

Steel base and stem

BASE
Zinc-plated steel.

DAMPING ELEMENT
NR rubber, hardness 80 Shore A, black colour, matte finish.

LEVELLING PLATE
Zinc-plated steel.

PACKING RING
NBR synthetic rubber O-Ring.

THREADED STEM
Zinc-plated steel, supplied not assembled.

NUT AND WASHER
Zinc-plated steel.

FEATURES
ELESA vibration-damping levelling elements have been designed to damp vibrations, shocks and noises produced by moving bodies or non-balanced vibrating masses of equipment and machines which can cause:
- malfunctioning and reduction of the machine lifespan and/or of the adjacent ones;
- damage to operator's health;
- noise.
- Put the base of the vibration-damping element under the machine and insert the stem through the hole (not threaded) in the frame of the machine (fig.1)
- Turn the square end of the stem to take the levelling plate in contact with the machine thus obtaining the levelling required. Then lock with nut and washer (fig.2)

TECHNICAL DATA AND GUIDELINES FOR THE CHOICE

1. Basic data required:
- disturbing frequency: the frequency of the disturbing vibration produced by a on-duty machine. In general, it is obtained by the number of rotations of the engine [Hz=r.p.m./60];
- the load applied to every single vibration-damping element [N];
- the isolation degree required [%];
- the deflection value of the vibration-damping element under a given load [mm];
- the rigidity, that is to say the load that applied to the vibration-damping element produces a deflection of 1.0 mm [N/mm].

2. How to choose the vibration-damping element:
- with reference to the diagram for checking the isolation degree, intersect the disturbing frequency value with the isolation degree required (each isolation degree corresponds to a line in the diagram) and define the deflection [in mm];
- divide the load applied onto the vibration-damping element by the deflection value to obtain the required rigidity of the vibration-damping element;
- compare the rigidity obtained with the rigidity shown in the table and choose the vibration-damping element which presents the nearest value (lower) to the calculated one.

3. Check:
- the deflection of the vibration-damping element chosen can be obtained in the graph on the basis of the load;
- intersect the disturbing frequency value with the vibration-damping element deflection value in the diagram to obtain the isolation degree offered by the vibration-damping element chosen;
- compare the obtained value with the isolation degree required.

4. Example:
- Conditions of use: disturbing frequency = 50 Hz (3,000 r.p.m.); load applied to every levelling element = 4,000 N; a 80% isolation degree is required;
- diagram shows that with a 50 Hz disturbing frequency and an isolation degree of 80%, the deflection obtained is 0.6 mm;
- divide the load applied by the deflection obtained to define the rigidity required, which is 4,000/0.6= 6,666 N/mm;
- compare the rigidity value obtained (6,666 N/mm) with the values reported in the table. This value is within the rigidity value reported in the table for LW.A-120 (4,000 N/mm) and LW.A-160 (9,000 N/mm). Choose the vibration-damping element with the lower value that is LW.A-120.
- graph shows that LW.A-120 (4,000 N/mm) deflection is 1mm.
- by intersecting the deflection value with the disturbing frequency of 50 Hz in the diagram, the isolation degree obtained is 90%.

This value is even greater than the required one; your choice has proved to be correct.

Levelling feet with vibration damping element

SPECIFICATION

Types

- Type **A**: with two-hole flange (d_1 = 60 / 90 / 113)
- Type **B**: with four-hole flange (d_1 = 113 / 126)

Identification no.

- No. **1**: without tear-off lock
- No. **2**: with tear-off lock

Vibration damping element
Natural rubber (NR)

vulcanized
temperature resistant up to 80 °C
Hardness Shore A ±5 °

soft* 43
medium 57
hard* 68
* not available from stock, requires a minimum order quantity

Sheet metal
zinc plated, blue passivated

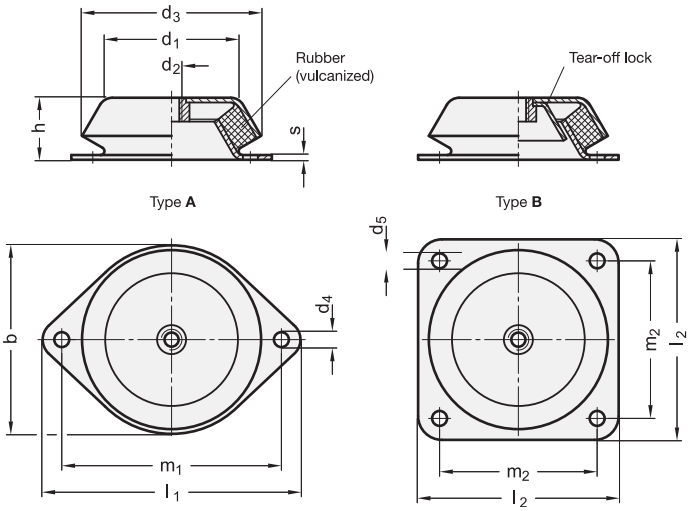
Threaded insert
Steel
zinc plated, blue passivated

ACCESSORY

- Rubber pads GN 148.2 (see page 1307)

INFORMATION

Levelling feet GN 148 are designed for setting up heavy machinery and units with insulation against vibrations.
This has a positive impact on the lifetime of machines and additionally reduces the noise pollution.
The structure is such that horizontal forces are also absorbed. The design with tear-off lock (Type 2) protects the levelling feet from destruction caused by tear-off under excessive tension loads.
The details relating to the load bearing capacity are non-binding recommended values and rule out any liability. They constitute no general warranty of quality and condition. The user must determine from case to case whether a product is suitable for the intended use.



*Complete with Identification no. of the Levelling feet (1 or 2)

1 without tear-off lock
2 with tear-off lock

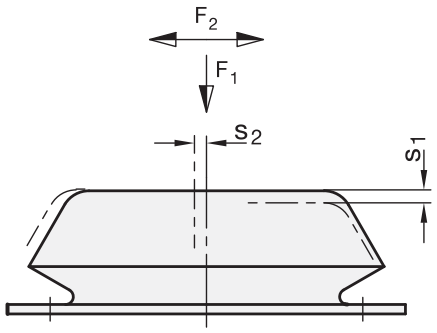
Levelling feet with vibration damping element



TECHNICAL INFORMATION (TERMS)

F_1 = static load in vertical direction (pressure)
F_2 = static load in horizontal direction (lateral thrust)
s_1 = Compression in vertical direction (spring excursion) under load thorugh F_1
s_2 = Compression in vertical direction (spring excursion) under load through F_2

Stiffness R:
is the load which causes the damping elements to be compressed by 1 mm (spring rate)

Equation for calculating the stiffness: R = F / S

The table below gives details on the maximum static load F, the maximum rated compression and the resulting stiffness R.
The method shown and the values given below allow the maximum degree of insulation of the vibration to be determined as a factor of the interference frequency.

d1	Hardness in Shore	max. static load F1 in N	Stiffness R1 in N/mm	max. compression s1, in mm	max. static load F2 in N	Stiffness R2 in N/mm	max. compression s2 in mm

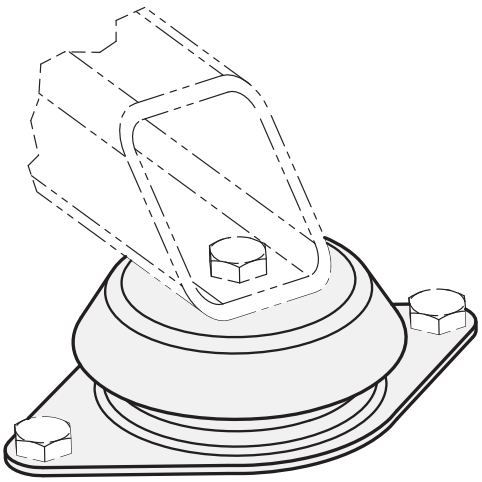
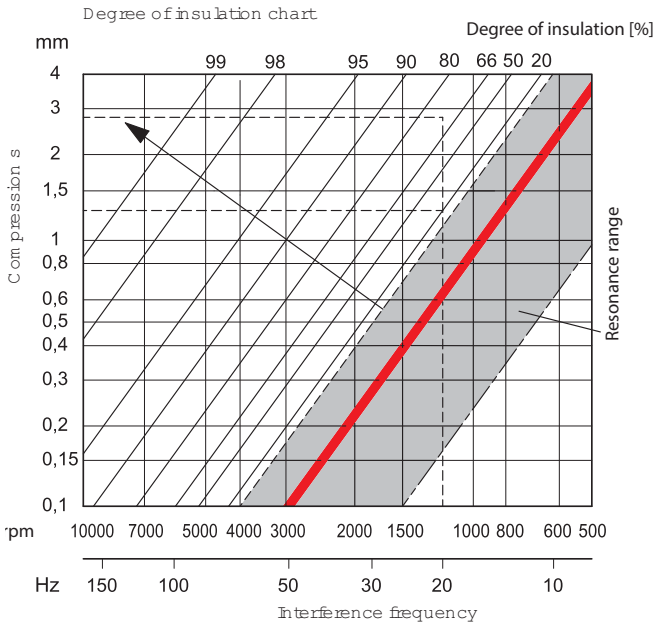
EXAMPLE OF APPLICATION





Terms

Interference frequency [Hz]:
is the frequency emanating from a machine, e.g. the machine main shaft speed [rpm].

Static load F [N]:
is the load acting on each vibration-damping element (levelling foot).

Degree of insulation [%]:
is the measure for absorbing the interference frequency (damping).

Compression s [mm]:
is the change in height of the damping element (spring excursion).

Stiffness R [N/mm]:
is the load which causes a damping element to be compressed by 1 mm (spring rate).

Determining the suitable levelling foot and the maximum degree of insulation

First, the static load F for each levelling foot must be determined. For well arranged levelling feet and the resulting even distribution of the load F, the static load is calculated using the following equation:

Weight force of the machine [N] / Number of levelling feet = Static load F [N] / per levelling foot

Once the static load F has been calculated, select a levelling foot from the table. Please note that the static load F should be as close as possible to the static load capacity, but without exceeding it. The associated stiffness R of the selected leg is also shown in the table.
The actual compression is then calculated using the equation below.

Static load F[N] / per levelling foot / Stiffness R [N/mm] = actual compression s [mm]

Starting from the actual compression s calculated, the maximum degree of insulation as factor of the interference frequency can now be read in the above chart.
To optimise the maximum degree of insulation, change the number of feet such that the static load F of each levelling foot is as close as possible below a static load capacity value given in the table. This will increase the compression s which, in turn, improves the degree of insulation.
In general, medium and high frequencies can be very well insulated with an adequate compression.

GN 148.2

Rubber pads

for levelling feet GN 148

SPECIFICATION

Types

- Type **A**: for two-hole flange (d_1 = 60 / 90 / 113)
- Type **B**: for four-hole flange (d_1 = 113 / 126)

Rubber (NBR)

- Hardness 68 Shore A ±5, black
- oil resistant

INFORMATION

Rubber pads GN 148.2 in connection with GN 148 (see page 1304) levelling feet are used for setting up machines and units if no firm bolt connection to the ground is required.
To be fixed to the levelling foot, they are snapped into the attachment bore holes of the flanges. Small pimples at the bottom face of the rubber pads enhance the stability.

TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)

Levelling feet

with vibration damping / female thread

SPECIFICATION

Type

- Type **SV**: with damping element

Steel

- Tensile strength class 5.8
- zinc plated, blue passivated

Damping element
Elastomer (PUR)

- Sylomer SR 450-12
- anti-slip, glued
- grey
- oil resistant
- Operating range form -30 °C up to 70 °C

Hexagon nut ISO 4032
Steel zinc plated, blue passivated

INFORMATION

The specified load in the table of the levelling feet GN 342.1 is a recommendation up to which the damping element can be **permanently** subjected.
This static load equals a thrust on the area of 0.4 N/mm^2 at which the damping material reaches its optimum dynamic damping ability. This also takes into account an additional load up to 0.6 N/mm^2 in the event of a dynamic load.
Levelling feet GN 342.1 cannot be disassembled.

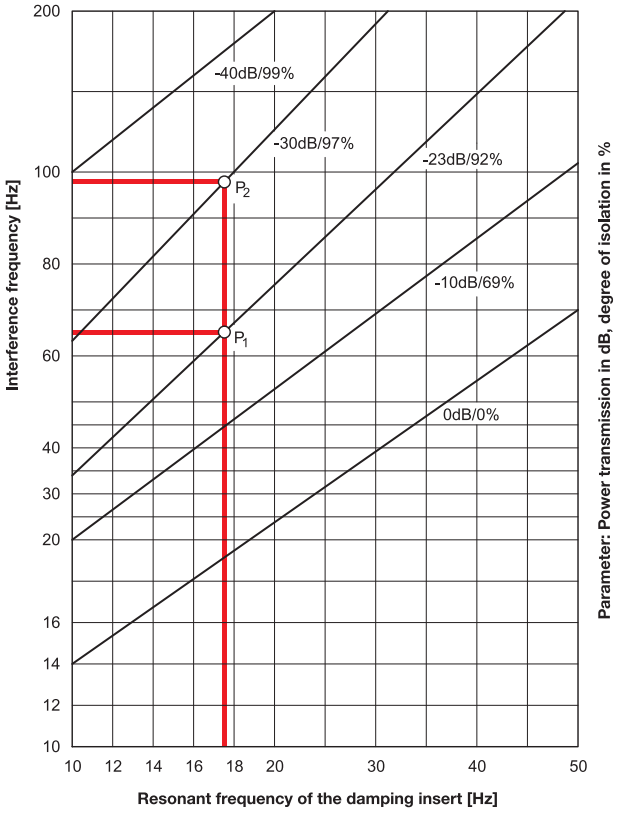
Vibration absorption - Performance graph

When using levelling feets GN 342.1 (see page 1308) and GN 342.2 the following differentiation in vibration absorption is made:
Active vibrations:
Vibrations transmitted to surroundings or associated equipment from working machinery for example.
Passive vibrations:
Vibrations transmitted to equipment or parts from vibrating surroundings or bases.
The efficiency of vibration absorption is dependent upon the interference frequency of the vibration to be absorbed as well as on the resonant frequency of the damping element itself.
A vibration absorbing effect is only achieved when the interference frequency is greater than √2-times the resonant frequency of the damping element. The greater the difference [Δ] between the two, the better the damping effect.
The resonant frequency of the damping pad is dependant upon type (composition) of the material cross section and the static load.
The graphs on the left show all the required data of the standard material (SR 450-12) of the damping element. Damping elements with other absorption properties are available on request.



Example

Assume a load per levelling foot: 400 N
Compression levelling foot d_1 = 32
400 N / 707 mm² = 0.57 N/mm²
Compression levelling foot d_1 = 40
400 N / 11340 mm²= 0.34 N/mm²
Therefore levelling feet with d_1 = 40, that exert a pressure of 0.4 N/mm² should be preferred.
The above graph shows:
Resonant frequency with compression 0.34 N/mm²:17.5 Hz
The lower graph shows:
Degree of isolation at 66 Hz interference frequency (P1): 92 %
Degree of isolation at 98 Hz interference frequency (P2): 97 %
At approximately 200 Hz interference frequency the degree of isolation is 100 %.

GN 6311.3

Foot plates

for grub screws DIN 6332 / tommy screws DIN 6304 / DIN 6306

SPECIFICATION

Types

- Type **OS**: without plastic cap
- Type **KS**: with plastic cap, gliding
- Type **KR**: with plastic cap, non-gliding

Steel
zinc plated, blue passivated

Snap ring
Spring steel wire
zinc plated, blue passivated

Plastic caps

Type KS
Technopolymer (Polyacetal POM)
white (natural colour) RAL 9001

GN 6311.4

Levelling feet

Steel, zinc plated

SPECIFICATION

Types

- Type **OS**: without plastic cap
- Type **KS**: with plastic cap, gliding
- Type **KR**: with plastic cap, non-gliding

Steel

- Tensile strength class 5.8
- zinc plated, blue passivated

Plastic caps:

Type KS
Technopolymer (Polyacetal POM)
white (natural colour) RAL 9001

Type KR
Elastomer (TPE)
78 Shore A ≈, black

INFORMATION

Levelling feet GN 6311.4 are normally used when a thread is present at the machine side to adjust the height.
The pin diameter d_3 is smaller than the core diameter of the thread, with the effect that the screw can be turned in at the pin. The pressure pin is easily inserted into the plate, with the retaining ring ensuring that the assembly is secure in axial direction.
The static load of the levelling feet GN 6311.4 is limited by the laod capacity of the grub screw (Tensile strength class 5.8). The static load values (only valid for Type OS/KS) in the table refer to a net vertical load in relation to the ball socket. Under normal operating conditions side loading or angular loading is not uncommon and the load capacity would be considerable reduced which must be taken into consideration.

INFORMATION

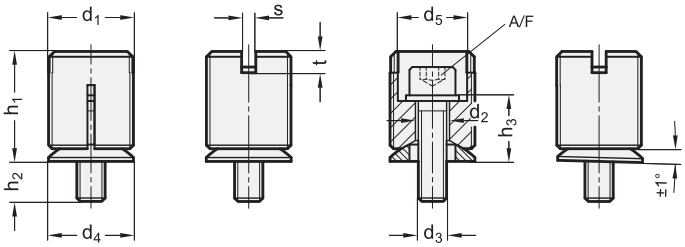
Levelling parts GN 355 are used for levelling and adjustment in machines and equipment.
They consist of a levelling screw, a cylinder screw with disk and a spherical washer. After making the adjustment using the assembly tools GN 355.1 (see page 1315) available as accessory, the screw is tightened firmly causing the levelling screw and the spherical washer DIN 6319 underneath to spread and is so secured against twisting in the taphole.
The values for w and x given in the table and for the static load capacity are to be seen as reference values which may differ depending on the prevailing situation. In general, they do not constitute a warranty of condition. The user must determine whether the product is suitable for the intended purpose.

ACCESSORY

- Assembly tools GN 355.1 (Code no. see table)

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)



Application example

GN 355.1

Assembly tools

for levelling parts GN 355

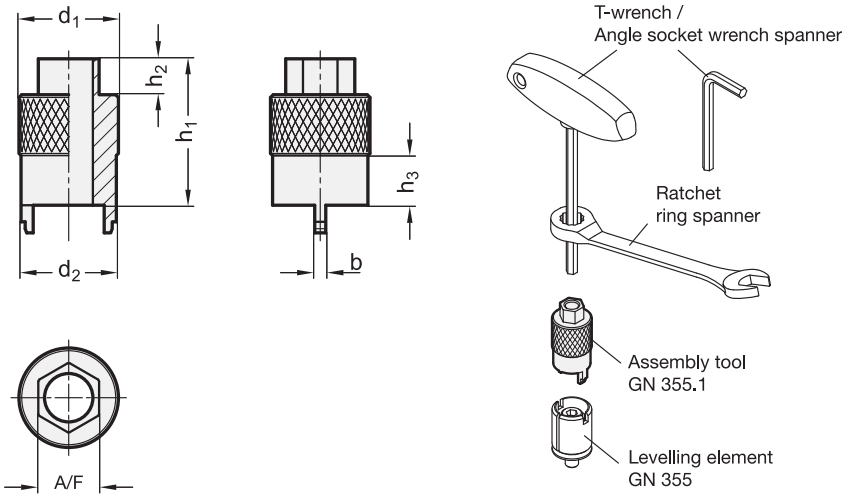
SPECIFICATION

Steel

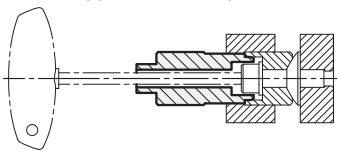
- surface hardened
- blackened

INFORMATION

GN 355.1 assembly tools serve to adjust GN 355 levelling elements. They are used in connection with a T-wrench or a hexagonal angle socket spanner. To ease levelling, the top end of the assembly tool has an external hexagon head which is used for turning the levelling screw with a ring spanner, ideally with a ratchet function.
For adjustment, first use the assembly tool to turn the levelling screw of the levelling element into the desired position and at the same time tighten the screw to secure the levelling element. To ensure that the setting found does not change, the assembly tool may be used to counterhold.



Application example



GN 355.1

Description	d1	b	d2	h1	h2	h3	A/F	Max. permissible torque in Nm	⚖

Square end-caps for tubes

Technopolymer

MATERIAL

Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

STANDARD EXECUTION

Nickel-plated brass boss with threaded pass-through hole.

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

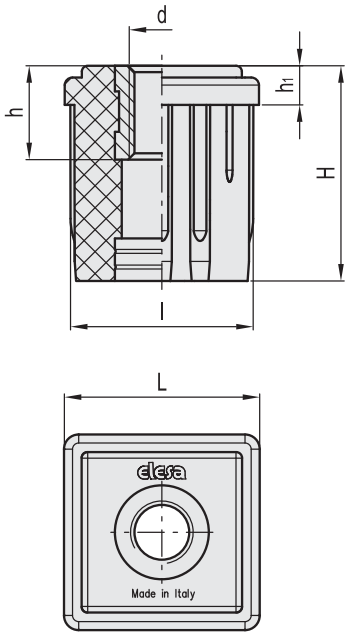
Square end-caps for tubes

heavy loads, technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

STANDARD EXECUTION
Nickel-plated brass boss with threaded pass-through hole.

FEATURES
They can also bear slipping loads contrariwise.



ELESA Original design

***** The max static load is the value above which the load applied to the element may cause some plastic material breakage, in particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

End-caps for square tubes

Technopolymer

MATERIAL
Polyamide based (PA) technopolymer, black colour, matte finish.

STANDARD EXECUTION
DIN 934 zinc-plated steel nut (included in the supply).

FEATURES AND APPLICATIONS
The two end-cap parts are connected together by means of two pins which are housed in special counter-seats. A cavity inside the end-cap is provided for housing an hexagonal nut DIN 934.
The assembly can be performed simply by positioning the end-cap inside the tube, with no need of screws or other fasteners.

SPECIAL EXECUTIONS ON REQUEST
End-cap without nut.

***** The max limit static load is the value above which the load applied to the element may cause some plastic material breakage, under particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value. The values shown in the table refer to the use of the end-cap in combination with a steel tube. The use of an aluminum tube may cause a decrease in the max limit static load equal to 25% due to possible deformations of the tube section under load.

End-caps for round tubes

Technopolymer

GN 992

Insert bushings

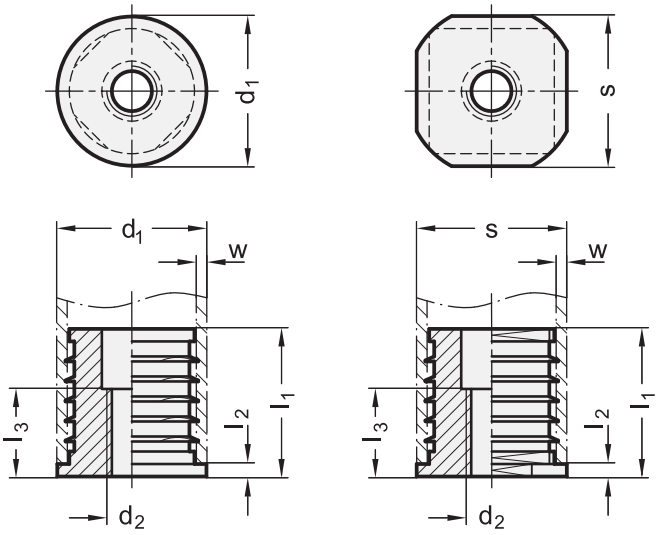
Aluminium / for round tube and square tube

SPECIFICATION

Aluminium
blank

INFORMATION

Drive the insert bushings GN 992 in by using a soft-head mallet. Their lamellas bridge a production tolerance of the internal diameter or of the internal square of ±0.5 mm, allowing screws to be mounted in tubes.
The dimensions match those of the construction tubes GN 990 (see page 1902), but checking the tolerance position of the tube is recommended.



Application example

Square tube connectors

Technopolymer and steel

CONNECTOR
It consists of two parts made out of polyamide (PA) based technopolymer, black or grey colour, matte finish.

REINFORCEMENT
Zinc-plated steel or stainless steel (STC-SST).

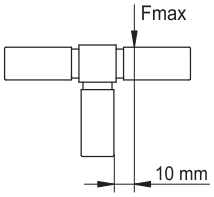
COLOR
Black or grey, matte finish.

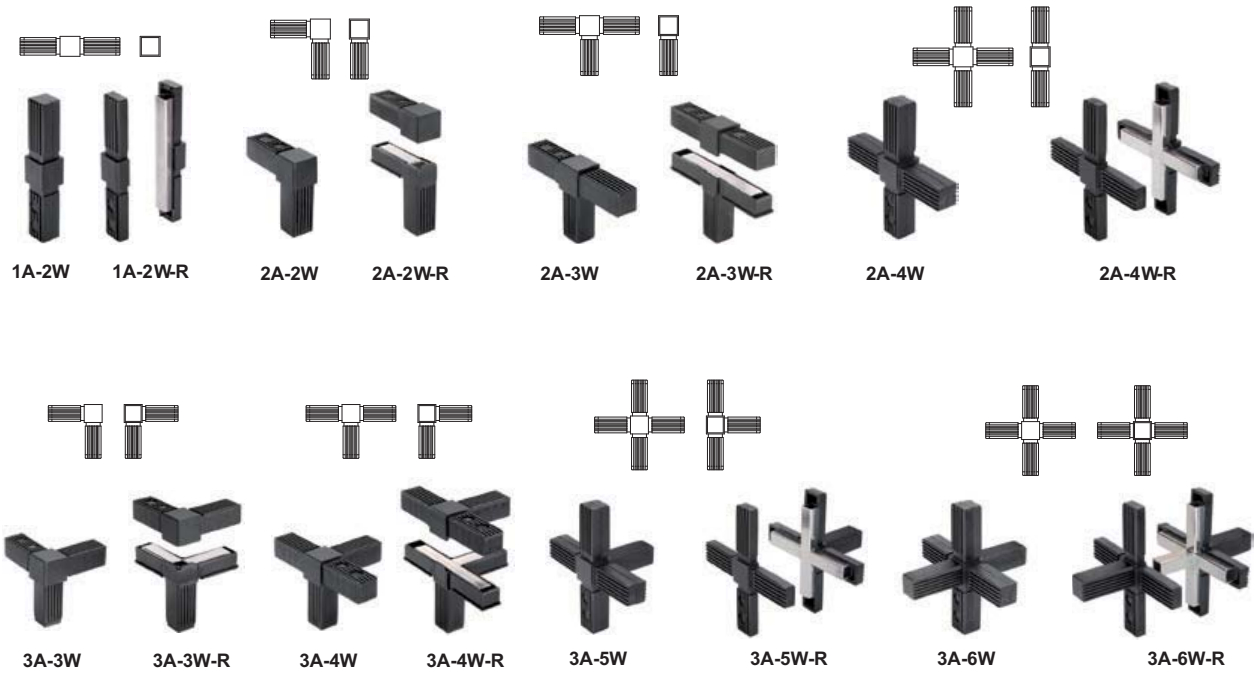
STANDARD EXECUTIONS
- **1A-2W**: monodimensional two-way connector.
- **2A-2W**: bidimensional two-way connector.
- **2A-3W**: bidimensional three-way connector.
- **2A-4W**: bidimensional four-way connector.
- **3A-3W**: tridimensional three-way connector.
- **3A-4W**: tridimensional four-way connector.
- **3A-5W**: tridimensional five-way connector.
- **3A-6W**: tridimensional six-way connector.

Index for connectors with reinforcement:
- **R**: zinc-plated steel reinforcement.
- **R-M10**: zinc-plated steel reinforcement with threaded hole.
- **R-SST**: stainless steel reinforcement.

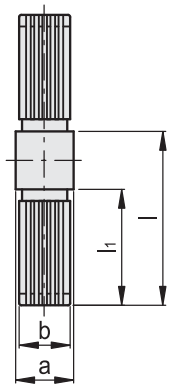
FEATURES AND APPLICATIONS
Suitable for creating structures composed by square profiles. The assembly can be performed simply by positioning the connector, forcing it, inside the profile, with no need of screws or other fasteners. The maximum limit static load for each arm of the connectors with steel reinforcement (STC-R and STC-R-SST) is shown in Fig. 1. The maximum limit static load is the value above which, under particular conditions of use, the load applied to the element may cause breakage. As a consequence, a suitable factor must be applied to this value, according to the importance and safety level of the specific application.

Fig.1

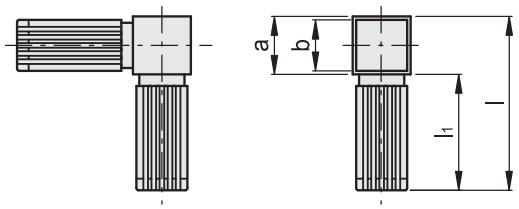




STC-1A



STC-2A



C9 RAL9005 C33 RAL7040

The drawing shows the assembled connector. The two tecnopolymer pieces composing it may have different shapes depending on the dimensions and / or executions.

Square tube connectors

with adjustable angle, technopolymer

CONNECTOR

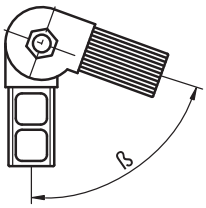
Polyamide based (PA) technopolymer, black colour, matte finish.

STANDARD EXECUTIONS

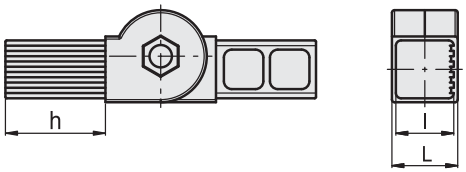
- **2A-2W**: bidimensional two-way connector.
- **3A-3W**: tridimensional three-way connector.

FEATURES AND APPLICATIONS

Suitable for creating structures composed by square profiles. The assembly can be performed simply by positioning the connector, forcing it, inside the profile, with no need of screws or other fasteners.



2A-2W



3A-3W

***** The value refers to laboratory tests carried out with a load applied vertically to the leveling element unscrewed from the end-cap of 10 mm and leaning on a flat surface. The max limit static load is the value above which the load applied to the element may cause some plastic material breakage, under particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value.

End-caps for round tubes

with adjustable height levelling element, technopolymer

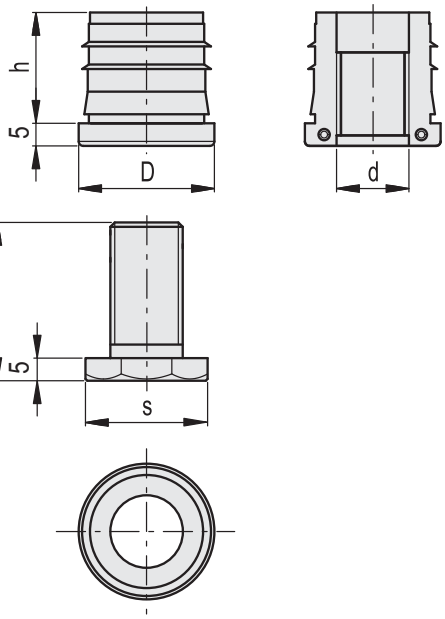
MATERIAL

Polyamide based (PA) technopolymer, black colour, matte finish.

FEATURES AND APPLICATIONS

End-caps for round tubes with adjustable height levelling element. The assembly can be performed simply by positioning the end-cap, forcing it, inside the tube, with no need of screws or other fasteners.

NDA.T-20 ÷ NDA.T-40



NDA.T-45 ÷ NDA.T-50

Square tube expander end-caps

Technopolymer

END-CAP
Polyamide based (PA) technopolymer, black colour, matte finish.

STANDARD EXECUTION
DIN 934 zinc-plated steel nuts (included in the supply).

FEATURES AND APPLICATIONS
The two end-cap parts have some reference pins which are housed in special counter-seats. Two cavities inside the end-cap are provided for housing two hexagonal nuts DIN 934.
Thanks to the tapered shape of the cavity, the end-cap exerts a pressure on the inner walls of the tube, due to the tightening of the nuts, thus ensuring the tensile strength of the connection.
The level of the tensile strength depends on the tube dimensional tolerances, the condition of the tube inner surfaces and the tightening torque applied.
The end-cap enables the joining of square tubes with other elements or the installation of wheels or levelling elements with locking nut.
The installation of a simple levelling element does not enable the expansion of the end-cap: for this kind of applications the use of NDL.Q (see page 1321) end-caps is a more proper alternative.
The assembly can be performed simply by positioning the end-cap inside the tube, with no need of screws or other fasteners.

SPECIAL EXECUTIONS ON REQUEST
End-cap without nuts or assembled with only one nut DIN 934.

***** The max limit static load is the value above which the load applied to the element may cause some plastic material breakage, under particular conditions of use. Obviously, a factor that takes into consideration the importance and the safety level of the specific application must be applied to this value. The values shown in the table refer to the use of the end-cap in combination with a steel tube. The use of an aluminum tube may cause a decrease in the max limit static load equal to 25% due to possible deformations of the tube section under load.

Round tube expander end-caps

Technopolymer

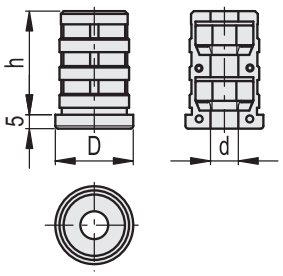
MATERIAL
Polyamide based (PA) technopolymer, black colour, matte finish.

STANDARD EXECUTION
DIN 934 zinc-plated steel nuts (included in the supply).

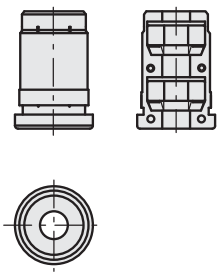
FEATURES AND APPLICATIONS
The two end-cap parts have some reference pins which are housed in special counter-seats. Two cavities inside the end-cap are provided for housing two hexagonal nuts DIN 934.
Thanks to the tapered shape of the cavity, the end-cap exerts a pressure on the inner walls of the tube, due to the tightening of the nuts, thus ensuring the tensile strength of the connection.
The level of the tensile strength depends on the tube dimensional tolerances, the condition of the tube inner surfaces and the tightening torque applied.
The end-cap enables the joining of round tubes with other elements or the installation of wheels or levelling elements with locking nut.
The installation of a simple levelling element does not enable the expansion of the end-cap: for this kind of applications the use of NDL.T (see page 1322) end-caps is a more proper alternative.
The assembly can be performed simply by positioning the end-cap inside the tube, with no need of screws or other fasteners.

SPECIAL EXECUTIONS ON REQUEST
End-cap without nuts or assembled with only one nut DIN 934.

NDE.T



NDE.T-25x1.5-M10



The geometry of the end-cap in the part that is inserted into the tube may vary for the different dimensions.

Round tube expander connectors

Technopolymer

MATERIAL

Polyamide based (PA) technopolymer, black colour, matte finish.

FEATURES AND APPLICATIONS

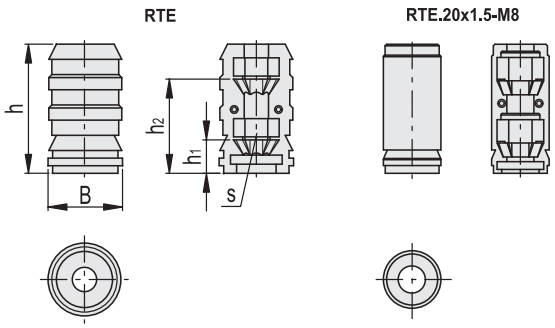
The two connector parts are connected together by means of pins which are housed in special counter-seats. Two cavities inside the connector are provided for housing an hexagonal-head screw or an hexagonal nut. Thanks to the tapered shape of the cavity, the connector exerts a pressure on the inner walls of the tube, due to the tightening of the screw or of the nut, thus ensuring the tensile strength of the connection. The level of the tensile strength depends on the tube dimensional tolerances, the roughness of the tube inner surfaces and the tightening torque applied.
The connector allows the joining of round tubes to one another or to other elements.
The assembly can be performed simply by positioning the connector, forcing it, inside the profile, with no need of screws or other fasteners.

ASSEMBLY OF THE TUBE TO THE CONNECTOR

It can be made as an alternative with:
- Hexagonal-head screw DIN 933 of dimension as shown in the table.
- Hexagonal nut DIN 934 of dimension as shown in the table.
- Self-locking hexagonal nut DIN 985 of dimension as shown in the table.

SPECIAL EXECUTIONS ON REQUEST

Connector assembled with nut or screw.



The geometry of the end-cap in the part that is inserted into the tube may vary for the different dimensions.

Square tube expander connectors

Technopolymer

MATERIAL

Polyamide based (PA) technopolymer, black colour, matte finish.

FEATURES AND APPLICATIONS

The two connector parts are connected together by means of pins which are housed in special counter-seats. Two cavities inside the connector are provided for housing an hexagonal-head screw or an hexagonal nut. Thanks to the tapered shape of the cavity, the connector exerts a pressure on the inner walls of the tube, due to the tightening of the screw or of the nut, thus ensuring the tensile strength of the connection. The level of the tensile strength depends on the tube dimensional tolerances, the roughness of the tube inner surfaces and the tightening torque applied. The connector has no collar and allows the joining of square tubes to other elements.
The assembly can be performed simply by positioning the connector inside the tube, with no need of screws or other fasteners.

ASSEMBLY OF THE TUBE TO THE CONNECTOR

It can be made as an alternative with:
- Hexagonal-head screw DIN 933 of dimension as shown in the table.
- Hexagonal nut DIN 934 of dimension as shown in the table.
- Self-locking hexagonal nut DIN 985 of dimension as shown in the table.

SPECIAL EXECUTIONS ON REQUEST

Connector assembled with nut or screw.

Ribbed tube end plugs

Polyethylene

MATERIAL
Polyethylene (PE), RAL 9005 (C9) black colour or RAL 7042 (C34) grey colour, satin finish.

STANDARD EXECUTIONS
- **NIL.Q**: for square tubes.
- **NIL.R**: for rectangular tubes.
- **NIL.T**: for round tubes.

FITTING
Their fitting to the round, square or rectangular section tube or profile ends can be made either by hand or by a mallet.

SPECIAL EXECUTIONS ON REQUEST
RAL 9003 white coloured inserts.

Mounts for levelling feet

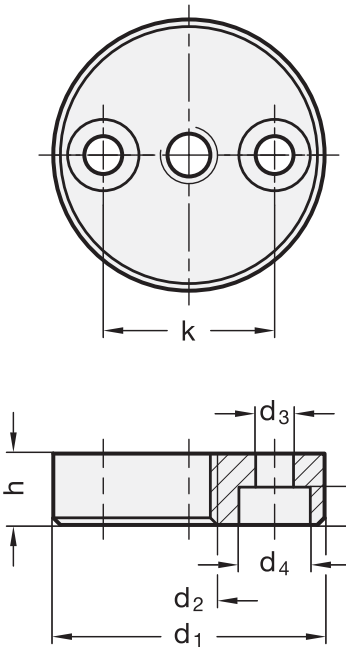
SPECIFICATION

Steel

- weldable
- blackened

INFORMATION

GN 349 mounts are used on levelling feet particularly in such cases where a machine shrouding is made of very thin sheet metal.



Installation example/ Mounting possibilities

Adapter for PC support clamp for round tubes

Technopolymer

ELESA Original design

MATERIAL

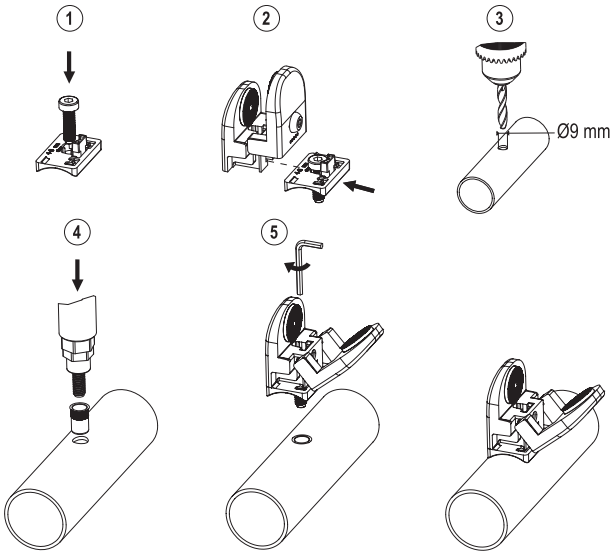
Glass-fibre reinforced polyamide based (PA) technopolymer, RAL 7042 grey colour, matte finish.

FEATURES AND APPLICATIONS

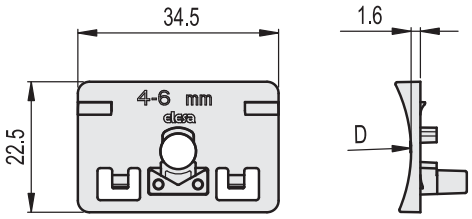
Kit for installation of PC support clamp on round tubes (thickness max. = 2 mm). The kit includes a technopolymer adapter, a M6 zinc-plated steel threaded insert to install with a normal riveter on the tube and a M6 cylindrical head screw.
The adapters give the best aesthetic result for panels of thickness between 4 and 6 mm and tubes with diameters as follows:
- 30÷34 mm
- 40÷43 mm
- 48÷52 mm.

ASSEMBLY INSTRUCTIONS

- Insert the M6 shorted cylindrical head screw with DIN 7984 hexagon socket into the plastic adapter.
- Insert the adapter into the slot of PC until the catch bracket clicks into position.
- Drill a hole in the tube of 9 mm.
- Fit the threaded insert on the tube with a riveter.
- Install the support clamp on the tube by tightening the screw into the threaded insert.



Adapter



Threaded insert

Panel support clamp

Technopolymer

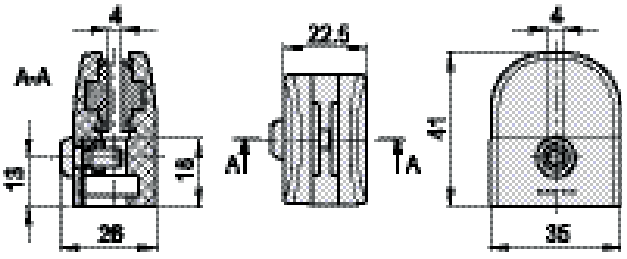
MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, RAL 7042 grey colour, matte finish.

PADS
Thermoplastic elastomer, hardness 80, Shore A, overmoulded.

ADJUSTING SPACERS (INCLUDED IN THE SUPPLY)
Polyamide based (PA) technopolymer, RAL 7042 grey colour clamp, for fastening panels with thickness higher than 4 mm.
Once it is engaged in the housing, the spacer is constrained to the clamp by means of an undercut.

FEATURES AND APPLICATIONS
- The product is in compliance with the Machine Directive (2006/42/CE) that provides for the retention of all the clamping elements in the open position too. (ELESA patent) The two parts of the tightening clamp are connected thanks to an articulated joint and they have got a seat for housing a screw and a M5 nut, which are retaining as well.
- The special dimensions of the clamp allow its assembly on profiles with a width of 25 mm or higher.
- The panel assembly into the clamp does not require any drilling which may cause cracks in the panel.
- The pads deform upon tightening to guarantee the perfect fastening of the inserted panel.
- The chemical bond of the overmoulded pads makes them a single body with the clamp. The embossed surface avoid any possible sticking of the pad to the panel over the time.
- The tightening clamp allows a direct assembly of panels with thickness from 3.1 mm to 4 mm. The assembly of panels with higher thicknesses, up to a maximum of 8 mm, is possible by inserting the spacers into a specific cavity provided in the clamp.
- To prevent machine danger zones being reached through any opening in the machine protection structure made of panels fixed with the PC clamp, it is necessary to keep a safety distance (Fig. 4) according to ISO 13857, section 4.2.4 (the safety distance is the minimum distance required between a protection structure and a potentially dangerous component of the machine).

TECHNICAL DATA
If the clamp is opened, the tightening screw does not yield below an extraction force of 250 N, without coming out from its housing.
During the tests carried out in our laboratories under controlled temperature and humidity (23°C-50% R.H.), under given conditions of use and for a limited period of time, the maximum load of each clamp is of 100 N (Fig. 5).
The tightening screw of the panel and the assembly screws of the clamp on the profile have got the same hexagonal seat. Thus, it is possible to make the assembly by using only one hexagonal key (Key 4). Maximum tightening torque for the screw = 3.5 Nm.



Code	Description	⚖
49301	PC.35	31

ERGOSTYLE®

ASSEMBLY OF THE CLAMP ON THE PROFILE
- M6 shorted cylindrical head screw with DIN 7984 hexagon socket (Fig.1).
- DIN 933 M6 hexagonal head screw (Fig. 2).
- DIN 439B or DIN 934 M6 hexagonal nut (Fig. 3).

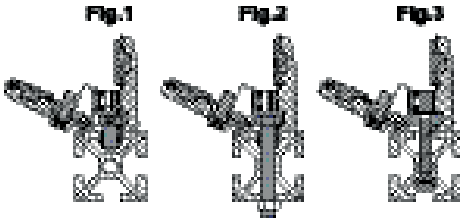


Fig. 4

Support clamp for panels and electro-welded mesh

mounting of the panel without drilling

ELESA Original design

MATERIAL
Glass-fibre reinforced polyamide (PA) SUPER-technopolymer, matte finish, RAL 9005 (C9) black colour or RAL 7040 (C33) grey colour.

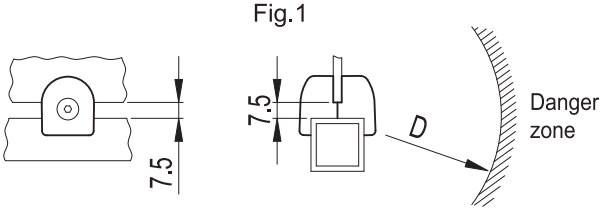
VIBRATION-DAMPING PADS
Made out of NBR rubber, hardness 90 Shore A, supplied assembled.

SCREW AND NUT
AISI 304 stainless steel countersunk head screw (UNI 5933) and M5 nut.

STANDARD EXECUTIONS
- **PPR**: for the mounting of panels, without vibration-damping elements.
- **PPR-A**: for the mounting of panels, with vibration-damping elements.
- **PPR-R**: for the mounting of electro-welded mesh type TEC® (max thread diameter 3 mm), without vibration-damping elements.

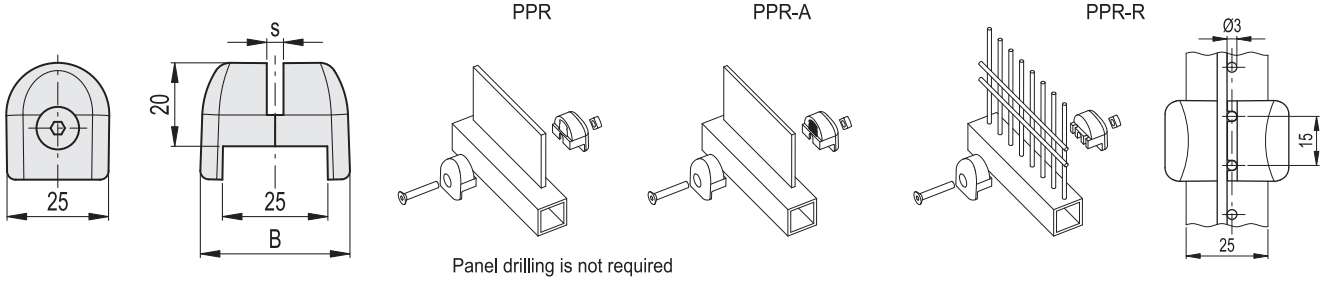
FEATURES AND APPLICATIONS
- Assembly on square-section profiles of 25 mm
- Panel drilling is not required for mounting.
- Rubber vibration-damping elements to ensure perfect locking of the panel even if not perfectly in tolerance or in the presence of strong vibrations.
- The distance of 7.5mm of the panel with respect to the profile avoids areas of dirt accumulation.
- Safety in compliance with ISO 13857, paragraph 4.2.4.
- The safety distance (D) is the minimum required distance between the protection structure and the potentially dangerous element of the machine (Fig.1).

Fig.1



Safety in compliance with ISO 13857

ASSEMBLY OF THE CLAMP ON THE PROFILE
- Tighten the clamp against the profile and the panel or the electro-welded mesh using the screw and the nut included in the package.



Panel drilling is not required

Bipod supports

Technopolymer

MATERIAL

Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

STANDARD EXECUTIONS

- **BAG2-120-A**: zinc-plated steel M10 screws, nuts and washers.
- **BAG2-120-SST**: AISI 304 stainless steel M10 screws, nuts and washers.

ASSEMBLY ON LEVELLING ELEMENTS

The bipod support bases are supplied with brass bosses, threaded pass-through hole for the assembly of the stem of the levelling element series LS.A, LV.A, LV.F.

FEATURES AND APPLICATIONS

The absence of cavities and the slightly round shapes offer modern and elegant aesthetics and guarantee the easy cleaning.

Guide rail clamps

Technopolymer

MATERIAL

Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

STANDARD EXECUTIONS

AISI 304 stainless steel cylindrical head screws with hexagon socket, nickel-plated brass nuts.

- **MPG-C**: for round guide.
- **MPG-T**: for both the standard trapezoidal guides.
- **MPG-R**: for rectangular guide.

ASSEMBLY INSTRUCTIONS

- Mount the guide rail clamp on the support bar (dimension 25x8 mm), the assembly consists in inserting the bar into the specific clamp slot (Fig.1).
- Insert the guide into the clamp housing and then clamp the screws (Fig.2).
- Set the height of the clamp and clamp by means of a M8 screw, not supplied (Fig.3).

MPG-2

Guide rail clamps

Technopolymer and stainless steel

MATERIAL

Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

STANDARD EXECUTIONS

AISI 304 stainless steel washers.

- **MPG-2C**: housings for round guides, without pin.
- **MPG-2C-P**: housings for round guides, with AISI 304 stainless steel pin and clamping nut.
- **MPG-2T**: housings for standard trapezoidal guides, without pin.
- **MPG-2T-P**: housings for standard trapezoidal guides, with AISI 304 stainless steel pin and clamping nut.
- **MPG-2R**: housings for rectangular guides, without pin.
- **MPG-2R-P**: housings for rectangular guides, with AISI 304 stainless steel pin and clamping nut.

ASSEMBLY INSTRUCTIONS

- Insert the guides into their housings in the rear part of the clamp.
- Couple the front part of the clamp to the rear part. Only for the trapezoidal guide the rear part must be coupled according to the trapezoidal guide dimensions (Fig.1).
- Insert the nut into the housing in the front part of the clamp.
- Screw the nut to clamp.

SPR.V

Guide rail brackets

for linear and angular positioning, technopolymer

BRACKET
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

GUIDE RAIL CYLINDER
Glass-fibre reinforced technopolymer. Black colour, matte finish.

STANDARD EXECUTIONS
Nickel-plated AISI 431 stainless steel eye screw.
Glass-fibre reinforced technopolymer clamping knob, black colour, matte finish, with nickel-plated brass hexagonal end for clamping by means of a key, threaded hole.
AISI 304 stainless steel screw, nut and washer for the fixing of guide rail cylinder to the bracket.
- **SPR.V-A**: with lower lip.
- **SPR.V-B**: without lower lip.

FEATURES AND APPLICATIONS
Particularly suitable when the angular and linear positioning needs to be executed in two different moments, for example when the distance between the guides has to be set more frequently than the angulation.

ACCESSORIES ON REQUEST
Spacer for guide rail bracket DSG-A (code 419676) or DSG-B (code 419677) in glass-fibre reinforced technopolymer, black colour, matte finish.

SPECIAL EXECUTIONS ON REQUEST
AISI 304 stainless steel guide rail cylinder.

ASSEMBLY INSTRUCTIONS
- Fit the guide rail bracket (Fig. 1).
- Assemble the guide rail cylinder to the support, with screw, nut and washer (Fig. 2).
- Insert the washer on the eye screw and assemble the knob (Fig. 3).
- Insert the eye in the guide rail cylinder housing (Fig. 4).
- Insert the guide pin in the guide rail cylinder hole. Set its linear and angular position and then clamp the knob (linear positioning) and the fixing nut of guide rail cylinder (angular positioning) (Fig. 5).

Guide rail brackets

for linear and angular positioning, technopolymer

BRACKET
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

GUIDE RAIL CYLINDER
Glass-fibre reinforced technopolymer. Black colour, matte finish.

STANDARD EXECUTION
Nickel-plated AISI 431 stainless steel eye screw, AISI 304 stainless steel nut and washer.
- **SPR-A**: with lower lip.
- **SPR-B**: without lower lip.

FEATURES AND APPLICATIONS
Particularly suitable when linear and angular positioning of the guide rail is required.

ACCESSORIES ON REQUEST
Spacer for guide rail bracket DSG-A (code 419676) or DSG-B (code 419677) in glass-fibre reinforced technopolymer, black colour, matte finish.

ASSEMBLY INSTRUCTIONS
- Fit the guide rail bracket (Fig. 1).
- Insert the eye screw in the guide rail support hole and screw the relevant nut and washer (Fig. 2).
- Assemble the guide rail cylinder on the eye (Fig. 3).
- Insert the guide pin in the guide rail cylinder hole. Set its linear and angular position and then fasten the nut (Fig. 4).

Guide rail brackets

for linear positioning, technopolymer

BRACKET
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

STANDARD EXECUTIONS
Nickel-plated AISI 431 stainless steel eye screw and AISI 304 stainless steel washer.
- **SPF.V**: with glass-fibre reinforced technopolymer clamping knob, black colour, matte finish, nickel-plated brass hexagonal end for clamping by means of a key, threaded hole.
- **SPF.D**: without knob, with AISI 304 stainless steel clamping nut.

FEATURES AND APPLICATIONS
Particularly suitable when a linear positioning of the guide rail is required.
The vertical or horizontal positioning of the eye screw improves the assembly where necessary.

ACCESSORIES ON REQUEST
Spacer for guide rail bracket DSG-A (code 419676), in glass-fibre reinforced technopolymer, black colour, matte finish.

ASSEMBLY INSTRUCTIONS
- Fit the guide rail bracket (Fig. 1).
- Insert the washer into the eye screw and screw either the knob or the nut (Fig. 2).
- Insert the eye in its housing either in the horizontal or vertical position (Fig. 3).
- Insert the guide pin in its clamping hole, set the linear positioning and then fasten (Fig. 4).

Self-aligning brackets

square flanged, technopolymer

BRACKET
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

BUSHINGS AND WASHERS
AISI 304 stainless steel.

BEARING
High quality with traceability codes. Chrome steel.

LUBRICATOR
Nickel-plated brass.

PACKING RINGS
NBR rubber.

COVER
Glass-fibre reinforced polypropylene based (PP) technopolymer, RAL 7015 grey colour, matte finish.
Closed cap for head bracket or for pass-through shafts.

STANDARD EXECUTIONS
- **UCF-T**: head bracket with closed cover.
- **UCF-P**: bracket for pass-through shaft with drilled cover and NBR rubber packing ring for rotating shafts.

FEATURES AND APPLICATIONS
Overall dimensions are in compliance with ISO 3228.
A system of completely sealed packing rings assures the protection of the bearing from dirt ingress.
Max shaft misalignment = 2,5°.

INSTRUCTIONS OF USE
Assembly with shafts without end stops. For optimum operation, we recommend periodic lubrication with a common grease resistant to high temperatures and oxidation.

SPECIAL EXECUTIONS ON REQUEST
- AISI 440C stainless steel bearing.
- Bearing in inch sizes.
- Brackets for shafts with diameters in different sizes.
- Brackets in polypropylene based (PP) technopolymer, packing rings and oil seal type VITON®*.

COVER
Glass-fibre reinforced polypropylene based (PP) technopolymer, RAL 7015 grey colour, matte finish.
Closed cap for head bracket or for pass-through shafts.

STANDARD EXECUTIONS
- **UCP-T**: head bracket with closed cover.
- **UCP-P**: bracket for pass-through shaft with drilled cover and NBR rubber packing ring for rotating shafts.

FEATURES AND APPLICATIONS
Overall dimensions are in compliance with ISO 3228.
A system of completely sealed packing rings assures the protection of the bearing from dirt ingress.
Max shaft misalignment = 2,5°.

INSTRUCTIONS OF USE
Assembly with shafts without end stops. For optimum operation, we recommend periodic lubrication with a common grease resistant to high temperatures and oxidation.

SPECIAL EXECUTIONS ON REQUEST
- AISI 440C stainless steel bearing.
- Bearing in inch sizes.
- Brackets for shafts with diameters in different sizes.
- Brackets in polypropylene based (PP) technopolymer, packing rings and oil seal type VITON®*.

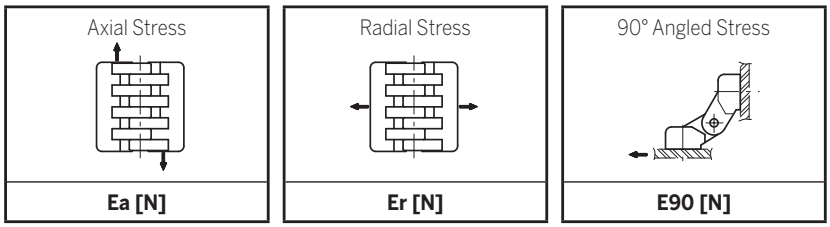
Guidelines for the correct application of plastic hinges

Materials of different type are used in accordance with the different structure and functionality of the hinges:

- High-resilience elastomer based technopolymer.
- Glass-fibre reinforced polyamide based or acetal based technopolymer.
- High-rigidity SUPER-technopolymer.

Resistance tests: two values are supplied for each product code:

- **Maximum working load (Ea, Er, E90)** is the value under which any elastic deformation that may occur is not permanent thus ensuring the hinge functionality.
- **Load at breakage (Ra, Rr, R90)** above which the plastic material can break.



For materials with high rigidity (SUPER-technopolymer) which are not significantly deformed even with loads very close to loads at breakage, only the max limit static load is given (Sa, Sr, S90). Therefore, the technical designer, when calculating the admissible load, will have to use a suitable factor according to the importance and the safety level of the specific situation.

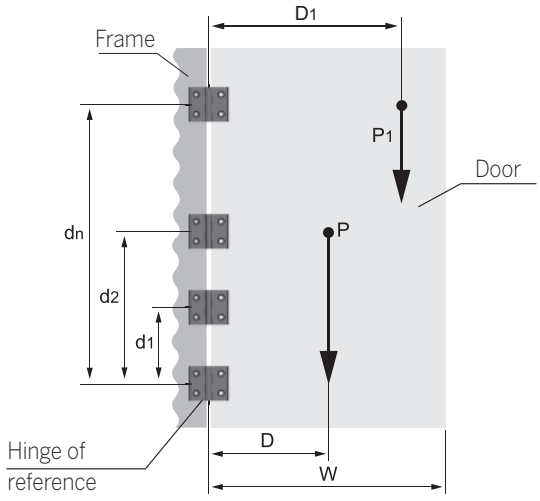
All the values shown in the tables **(Ea, Er, E90 e Sa, Sr, S90)** are the result of tests for the corresponding stresses carried out in our laboratories under controlled temperature and humidity (23° C - 50% R.H.) under given conditions of use and for a limited period of time.
When assessing the safety factor to apply, the technical designer shall take into consideration the actual conditions of use if they are different from the laboratory ones.
In order to help the technical designer to choose the right hinge and check its suitability to the specific application, we suggest asking for test samples and submitting the chosen product to tests in order to check its suitability.

The methods for calculating and interpreting the resistance values described in this catalogue have been updated in accordance with the latest improvements achieved.

Hinges CFN. and CFO. series: **E90** stress is not applicable, due to their geometry and structure.
CFSQ. and CFSW. hinges with built-in safety switch: being safety devices with specific properties, they require a specific argumentation which is illustrated in the product datasheet.

LOAD SUITABILITY CHECK
Hinged door on a vertical axis

P = weight of the door [Newton]
P1 = additional extra load [Newton]
W = width of the door
D = distance [metres] between the centre of gravity of the door and the hinge axis. In normal conditions D = W/2
D1 = distance [metres] between the hinge axis and the additional extra load application point
N = number of hinges
dT = sum of the distances in metres of all the hinges from the hinge of reference (dT = d1+d2+...+dn).
In case of only two hinges assembled, dT is simply the distance between them.
The three conditions must be satisfied.



$$\frac{(P+P1)}{N} \leq Ea$$

$$\frac{[(P \cdot D) + (P1 \cdot D1)]}{dT} \leq Er \text{ (closed door)}$$

$$\frac{[(P \cdot D) + (P1 \cdot D1)]}{dT} \leq E90 \text{ (90° open door°)}$$

Suggestions for a correct assembly
The correct assembly of the hinges requires a drilling on the mounting wall with diameter not wider than 0.5 mm of the diameter of the assembling screw in order to leave the least clearance possible. The suggested tightening torque should not be exceeded.

EXAMPLE

P = 10 Kg = **98 N** (10•9.81) weight of the door
P1 = 2 Kg = **20 N** (2•9.81) weight of the additional extra load applied (for example: handle, lock, machine control panel fitted onto the door)
W = 1 m width of the door
D = W/2 = 1/2 = **0.5 m** distance between the centre of gravity of the door and the hinge axis
D1 = **0.90 m** distance between the hinge axis and the additional extra load application point
N = **2** (evaluating use of two hinges)
dT = **1.3 m** (in this case it is simply the distance between the two hinges)

$$\frac{(P+P1)}{N} = \frac{(98+20)}{2} = 59N \leq Ea$$

$$\frac{[(P \cdot D) + (P1 \cdot D1)]}{d_T} = \frac{[(98 \cdot 0.5) + (20 \cdot 0.9)]}{1.3} = 51N \leq Er$$

$$\frac{[(P \cdot D) + (P1 \cdot D1)]}{dT} = \frac{[(98 \cdot 0.5) + (20 \cdot 0.9)]}{1.3} = 51N \leq E90$$

The suitable hinge can be chosen among those which present Ea, Er, E90 values higher than the calculated ones.
Take CFD., series for example, the suitable hinges are CFD.30 B-M3 and CFD.30 CH-B-M3, CFD.40 B-M4, CFD.40 CH-4-B-M4 and CFD.40 CH-4-p-M4x18, all CFD.48 and CFD.66.

Hinges CFD series satisfying the three conditions indicated in the example above.

RoHS PA +80° -20°

Hinges

Technopolymer

FM design

MATERIAL

High-resilience polyamide based (PA) technopolymer, black colour, matte finish. Grey RAL 7040 (C33) only for CFA-SH execution.

ROTATING PIN

AISI 303 stainless steel.

STANDARD EXECUTIONS

- **CFA-B**: nickel-plated brass bosses with threaded hole.
- **CFA-p**: nickel-plated steel threaded studs.
- **CFA-SH**: pass-through holes for countersunk head screws.
- **CFA-TI-SH**: pass-through holes for countersunk head screws and rear housing to accommodate the head of threaded inserts.
- **CFA-CH**: pass-through holes for cylindrical head screws.
- **CFA-B-p**: nickel-plated brass bosses with threaded hole and nickel-plated steel threaded studs.
- **CFA-B-SH**: nickel-plated brass bosses with threaded hole and pass-through holes for countersunk head screws.
- **CFA-B-CH**: nickel-plated brass bosses with threaded hole and pass-through holes for cylindrical head screws.
- **CFA-p-SH**: nickel-plated steel threaded studs pass-through holes for countersunk head screws.
- **CFA-p-CH**: nickel-plated steel threaded studs and pass-through holes for cylindrical head screws.

ROTATION ANGLE (APPROXIMATE VALUE)

Max 215° (-35° and +180° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

ASSEMBLY INSTRUCTIONS FOR CFA-TI-SH

1. Drill a hole in the door/doorframe with a diameter corresponding to the threaded insert used.
2. Fix the threaded insert on the door/doorframe with a riveter.
3. Fit the hinge on the door/doorframe tightening the screw into the threaded insert.

CFA-SL

Hinges with slotted holes of adjustment

Technopolymer

MATERIAL
High-resilience polyamide based (PA) technopolymer, black colour, matte finish.

ROTATING PIN
AISI 303 stainless steel.

STANDARD EXECUTIONS
Pass-through slotted holes for cylindrical head screws which allow the adjustment during assembly.
- **CFA-SL-H**: for horizontal adjustments.
- **CFA-SL-V**: for vertical adjustments.
- **CFA-SL-HV**: for both horizontal and vertical adjustments.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 215° (-35° and +180° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

Hinges

Technopolymer rotating pin

MATERIAL
High-resilience polyamide based (PA) technopolymer, black colour, matte finish.

ROTATING PIN
Acetal based (POM) technopolymer, black colour.

STANDARD EXECUTIONS
- **CFAX-B**: nickel-plated brass bosses with threaded hole.
- **CFAX-SH**: pass-through holes for countersunk head screws.
- **CFAX-CH**: pass-through holes for cylindrical head screws.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 215° (-35° and + 180° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical peformance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

EXECUTION CFK.
False hinge made up of a single body without rotation pin. It can be used for blocking fixed panels, when you want to obtain the same general aesthetical effect.

Hinges with detent position at 90°

Technopolymer

MATERIAL
High-resilience polyamide based (PA) technopolymer, black colour, matte finish.

ROTATING PIN
AISI 303 stainless steel.

STANDARD EXECUTIONS
- **CFA-F-B**: nickel-plated brass bosses with threaded hole.
- **CFA-F-CH**: pass-through holes for cylindrical head screws.
- **CFA-F-SH**: pass-through holes for countersunk head screws.

FEATURES AND APPLICATIONS
CFA-F hinges are recommended when the opening of the door must not exceed the limit of 90°.
Once the hinge is fitted onto the machine/door, the teeth of the detent system remain inside the hinge. Thus the operator cannot reach them for the safety of his hands.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 100° (-10° and +90° being 0° the condition where the two interconnected surfaces are on the same plane).
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

Hinges with friction brake

Technopolymer

MATERIAL
High-resilience polyamide based (PA) technopolymer, black colour, matte finish.

ROTATING PIN
Black-oxide steel.

STANDARD EXECUTION
Pass-through holes for countersunk head screws.

ADJUSTABLE HANDLE FOR CLAMPING
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.
Red writing "PUSH" tampoprinted on the lever body (avoid contact with solvents, alcohol or detergents containing alcohol).
Black-oxide steel retaining screw, AISI 302 stainless steel return spring.
Boss with threaded blind hole in black-oxide steel (CFA.49 and CFA.65) or brass (CFA.97).

ROTATION ANGLE (APPROXIMATE VALUE)
Max 215° (-35° and +180° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical peformance.

FEATURES AND APPLICATIONS
CFA-ERS hinge with friction brake allows to adjust the door open and close desired positions, and also the door clamping in any position within the rotation angle of 215°.

INSTRUCTIONS OF USE
The friction effect is obtained by clamping the two hinged bodies using the special adjustable handle.
To operate the adjusting mechanism, push down the lever (PUSH). By releasing the lever, the spring releases the toothing, thus the handle can return to its starting position and the lever can rotate freely together with the door without obstructing the movement, even in case of accidental shock.
The high number of teeth within the adjustable handle guarantees rotation even in case of very limited movement of the lever arm.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).
For strength data, see the correspondent products of the series CFA. (see page 1370).

Hinges with screw-covers

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ROTATING PIN
Acetal based (POM) technopolymer, black colour.

SCREW-COVERS
Polyester based (PBT) technopolymer, black colour, glossy finish, snap-in assembly.

STANDARD EXECUTIONS
- **CFT-SH**: pass-through holes for countersunk head screws.
- **CFT-EH**: hexagonal pass-through holes for cylindrical head screws, hexagonal head nuts or screws. CFT. hinge with boss or stud can be obtained by means of hexagonal head nuts or screws fitted into the assembly hole.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 200° (-20° and +180° being 0° the condition where the interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).
Screw-covers in different RAL colours.

Suggested tightening torque for assembly screws.

Hinges

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ROTATING PIN
Acetal resin based (POM) technopolymer, black colour.

STANDARD EXECUTIONS
- **CFTX-SH**: pass-through holes for countersunk head screws.
- **CFTX-EH**: hexagonal pass-through holes for cylindrical head screws. This hinge with boss or stud can be obtained by means of hexagonal head nuts or screws fitted into the assembly hole.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 200° (-20° and +180° being 0° the condition where the interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

Spring hinges

for automatic return, SUPER-technopolymer

MATERIAL
Glass-fibre reinforced polyamide (PA) SUPER-technopolymer body, black colour, matte finish.

ROTATING PIN
Aluminium.
Pin housing end caps made out of acetal based (POM) technopolymer, black colour.

RETURN SPRING
Stainless steel.

STANDARD EXECUTIONS
Pass-through holes for M6 cylindrical head screws.
- **CFMR-NC-035**: max return torque 0.35Nm (at 180°), holding torque 0.12Nm (at 0°).
- **CFMR-NC-070**: max return torque 0.70Nm (at 180°), holding torque 0.25Nm (at 0°).
- **CFMR-NO-035**: max return torque 0.35Nm (at 0°), holding torque 0.12Nm (at 180°).
- **CFMR-NO-070**: max return torque 0.70Nm (at 0°), holding torque 0.25Nm (at 180°).
- **CFMR-NS**: complementary hinge, no return spring.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 270° (-90° and +180° being 0° the condition where the two interconnected surfaces are on the same plane).
The hinge can reach -90 ° but this condition must not be used for CFMR-NO execution.
Do not exceed the rotation limit angle so as not to prejudice the correct operation of the return spring.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

FEATURES AND PERFORMANCES
CFMR hinge is used for the automatic re-closing or re-opening of the door by the return spring.
The torque varies progressively with the opening/closing angle of the hinge.
In special stress resistance tests, the return spring has exceeded 100,000 cycles while keeping the torque values unchanged.

	AXIAL STRESS	RADIAL STRESS	90° ANGLED STRESS
Resistance tests			
	Max limit static load Sa [N]	Max limit static load Sr [N]	Max limit static load S90 [N]
CFMR.	2100	3500	1900

The max static load is the value above which the material may break thus prejudicing the hinge functionality. Obviously, a suitable factor, according to the importance and the safety level of the specific application must be applied to this value.

Hinges

Technopolymer

MATERIAL
High-resilience polyamide based (PA) technopolymer, black colour, matte finish.

ROTATING PIN
AISI 303 stainless steel.

STANDARD EXECUTION
Pass-through holes for cylindrical head screws.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 275° (-95° and +180° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

INFORMATION

GN 237 hinges are characterized by their compact and stable design. The various material and surface choices in combination with two mounting types enable very specific applications.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Load rating information of hinges (see page A40)
- List of hinges types (see page 1362)

Hinges

Zinc die casting / Stainless Steel, extended, horizontally elongated

SPECIFICATION

Types

- Type **A**: 2x2 bores for countersunk screws
- Type **C**: 2x2 threaded studs

Version in Zinc die casting ZD

Zinc die casting
plastic coated
black, RAL 9005, textured finish **SW**
silver, RAL 9006, textured finish **SR**

Pin, Stainless Steel AISI 303 (A2)

Threaded stud (type C)
Stainless Steel AISI 316

Version in Stainless Steel (only type A) NI

- AISI CF-8
- matt shot-blasted **GS**

Pin, Stainless Steel AISI 316Ti (A4)

INFORMATION

Hinges GN 237 with extended hinge wings are made in a compact and sturdy design. They are used when larger spacings are required for the attachment bore holes.

CMM-AL

Hinges

Aluminium

MATERIAL
Anodised aluminium, natural colour, matte finish.

ROTATING PIN
AISI 304 stainless steel.

STANDARD EXECUTION
Pass-through holes for countersunk head screws.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 270° (-90° and +180° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.

GN 238

Hinges

adjustable / with cover / zinc die casting

SPECIFICATION

Types

- Type **BJ**: adjustable on both sides
- Type **EJ**: one-sided adjustable
- Type **NJ**: not adjustable

Zinc die casting
plastic coated
black, RAL 9005, textured finish **SW**
silver, RAL 9006, textured finish **SR**

Adjusting disc
Steel, hardened

Cover
Plastic

- black grey for type SW
- light grey for type SR

Pin
Stainless Steel AISI 303

INFORMATION

The adjustable hinges GN 238 allow the technically and visually perfect positioning and alignment of a door in its frame.
The steel adjusting disc has a cutting ring in its underside which cuts into the radial fins of the zinc die-cast wings when the countersunk screw is tightened, virtually creating a form-lock that prevents adjusting the hinge after mounting.
The covers conceal the fixing elements and lend the hinge an attractive optical appearance.

Stainless Steel-Spacer plates

for hinges GN 237, GN 337, CFMY CFM and GN 437

SPECIFICATION

Stainless Steel **NI**

- AISI 304
- plain, matt tumbled finish **MT**

INFORMATION

Chamfers, different sheet metal thicknesses, or seals could mean that the mounting surfaces of hinges to frame and door are not on the same level.
Stainless Steel-Spacer plates GN 2370, as accessories of the GN 237 (see page 1386) and 337 (see page 1423) family of hinges, are designed dimensionally so that they ensure the appropriate height compensation during mounting by shimming, either individually or in combination.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

The table includes a number of potential compensation heights which can be accomplished by shimming with one or two spacer plates.

Height compensation	Plate thickness s
1	1
1.5	1.5
2	1 + 1
2.5	1 + 1.5
3	3
4	3 + 1
4.5	3 + 1.5

GN 2372

Stainless Steel-Plates with tapped holes

for hinges GN 237, GN 337, CFMY and CFM

SPECIFICATION

Stainless Steel **NI**

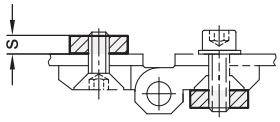
- AISI 304
- plain, matt tumbled finish **MT**

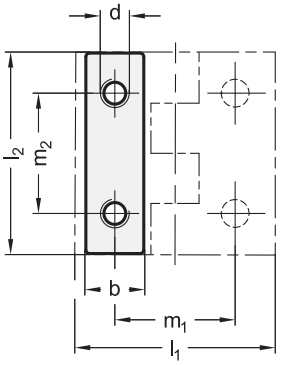
INFORMATION

Dimensionally, Stainless Steel plates GN 2372 are designed as accessories for the GN 237 (see page 1386) family of hinges, eliminating the need for nuts and washers for mounting.
Meanwhile, there is no need for the time-consuming pre-assembly of washer and nuts or for counterholding during tightening. Mounted to the top side of the hinge, the plate offers entirely new assembly options.

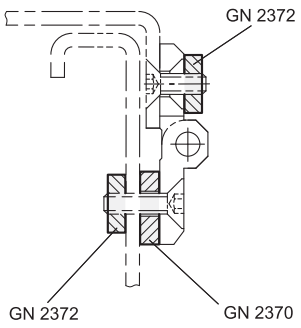
TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)





Application example



GN 2372 **STAINLESS STEEL**

Description	l2	b	d	l1	m1	m2	s	⚖

GN 2374

Rubber bumper stops

for hinges GN 237, GN 237.1, GN 337 and CFMY.

SPECIFICATION

Steel precision casting **ST**
zinc plated, plastic coated
black, RAL 9005, textured finish **SW**

Elastomer element

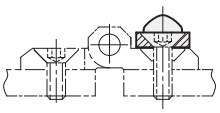
- Perbunan® (NBR)
- temperature resistant up to 120 °C
- Hardness 85±5 Shore A

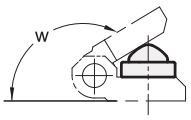
INFORMATION

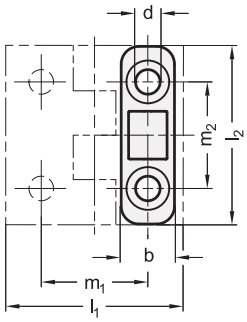
In terms of their dimensions, limit stops GN 2374 have been designed as extras for the GN 237 (see page 1386) and GN 337 (see page 1423) family of hinges. They can also be bolt-attached when mounting the hinge, with an elastomer element limiting the angle of rotation to the value w.
They are mainly used for lighter traps and gates, or when the limit stop is not expected to be exposed to dynamic loads.

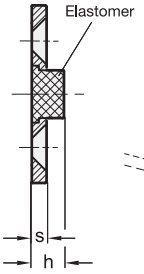
TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)

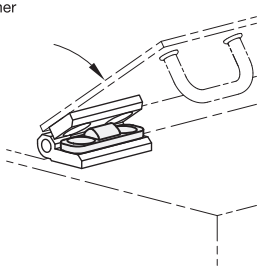








Application example



GN 2374

Description	l2	w	b	d	h	l1	m1	m2	s	⚖

GN 2374-ST-60-150-SW	60	150	18	8.3	10.9	60	36	36	5	21

Tamperproof hinges

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ROTATING PIN
AISI 303 stainless steel, totally moulded in the hinge body.

STANDARD EXECUTIONS
- **CFJ-B**: nickel-plated brass bosses with threaded hole.
- **CFJ-p**: nickel-plated steel threaded studs.
- **CFJ-EH**: pass-through holes for hexagonal head screws.
- **CFJ-B-SH**: nickel-plated brass bosses with threaded hole and pass-through holes for countersunk head screws.

FEATURES AND APPLICATIONS
The pin is totally moulded in the hinge body (ELESA patent) thus it cannot be extracted, preventing any hinge tampering.
This charatcteristic makes the hinge particularly suitable for mounting on structures or equipments requiring protection against intrusion.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 275° (-95° and +180° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

Hinge with adjusting inserts

SUPER-technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) SUPER-technopolymer, black colour, matte finish.

ADJUSTING INSERTS
Technopolymer, black colour.

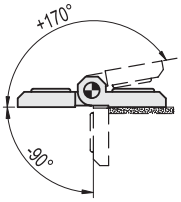
ROTATING PIN
AISI 303 stainless steel.

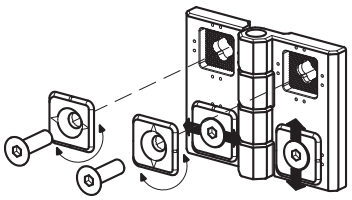
STANDARD EXECUTION
Pass-through holes for M6 countersunk-head screws.

FEATURES AND APPLICATIONS
The adjusting inserts (ELESA patent) are designed to compensate limited misalignments of doors. Vertical and horizontal adjustments are both possible by simply setting the orientation of the inserts, thus obtaining the perfect alignment between the door and the frame.
The knurling on the hinge body and on the rear of the inserts keep the precise position during the assembly of the hinge.
This hinge can be used to compensate vertical, horizontal or both misalignments.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 260° (-90° and +170° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

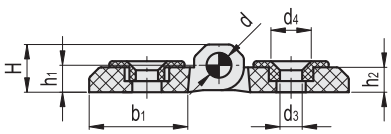
FM design

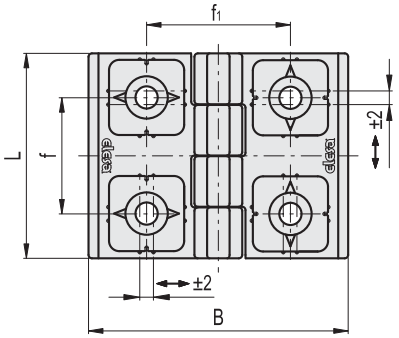




Resistance tests	AXIAL STRESS	RADIAL STRESS	90° ANGLED STRESS
				Max. limit stati load	Max. limit stati load	Max. limit stati load
Description	Sa [N]	Sr [N]	S90 [N]
CFR.60 SH-6	1800	2700	2130

The max static load is the value above which the material may break thus prejudicing the hinge functionality use. Obviously, a suitable factor, according to the importance and the safety level of the specific application must be applied to this value.





Code	Description	L	B	f	f1	H	h1	h2	b1	d	d3	d4	C# [Nm]	⚖

Suggested tightening torque for assembly screws.

GN 127

Hinges

adjustable / zinc die casting

SPECIFICATION

Types

- Type **H**: horizontal adjustable
- Type **B**: vertical adjustable
- Type **HB**: vertical and/or horizontal adjustable

Zinc die casting
plastic coated
black, textured finish

Pin
Stainless Steel AISI 303

INFORMATION

Hinges GN 127 allow technically and visually perfect positioning and alignment of a door in its frame.
The serrations at the wings of the hinge and at the adjusting bushings create a form lock which prevents the hinge from moving after installation. The tips of the arrows mark the 0 reference point for easier installation.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Load rating information of hinges (see page A40)
- List of hinges types (see page 1362)

Hinges for thin doors

Technopolymer

MATERIAL
High-resilience polyamide based (PA) technopolymer, black colour, matte finish.

ROTATING PIN
AISI 303 stainless steel.

STANDARD EXECUTIONS
- **CFD-B**: nickel-plated brass bosses with threaded hole.
- **CFD-p**: nickel-plated brass threaded studs in the wide body, nickel-plated steel threaded studs in the narrow body.
- **CFD-p-B**: nickel-plated brass threaded studs and nickel-plated brass bosses with threaded hole.
- **CFD-B-p**: nickel-plated brass bosses with threaded hole and nickel-plated steel threaded studs.
- **CFD-CH-B**: pass-through holes for cylindrical head screws and nickel-plated brass bosses with threaded hole.
- **CFD-CH-p**: pass-through holes for cylindrical head screws and nickel-plated steel threaded studs.

FEATURES AND APPLICATIONS
The hinge is made up of two bodies with different dimensions (a narrow one and a larger one) and can be assembled for example on structures with thin frame or door.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 205° (-15° and +190° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

Suggested tightening torque for assembly screws.

CMDX-AL

Hinges for thin doors

Aluminium

MATERIAL
Anodized aluminium, black or natural colour, matte finish.

ROTATING PIN
AISI 304 stainless steel.

GUIDE BUSHINGS FOR PIN
Polyamide based (PA) technopolymer.

ASSEMBLY SCREWS
Stainless steel self-tapping screws 4.8x15.9 DIN 7982 (frame side) and stainless steel M5x10 semi-rounded head screws (door side). Included in the supply.

STANDARD EXECUTIONS
- **CMDX-AL-P**: with bodies on the same plane.
- **CMDX-AL-R**: with raised body.
- **CMDX-AL-PS**: with bodies on the same plane, opening to the left side.
- **CMDX-AL-RS**: with raised body, opening to the left side.
- **CMDX-AL-PD**: with bodies on the same plane, opening to the right side.
- **CMDX-AL-RD**: with raised body, opening on the right side.

Index for finish:
- **AN**: anodised in natural colour.
- **AB**: anodised in black colour.

FEATURES AND APPLICATIONS
The hinge is made up of two bodies with different dimensions (a narrow one and a larger one) and can be assembled for example on structures with thin frame or door. Supplied not assembled for an easy fixing.

ELESA Original design

ROTATION ANGLE (APPROXIMATE VALUE)
Max 185° (-5° and +180° being 0° the condition where the two hinged surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to damage the hinge.

silver, RAL 9006, textured finish **SR**

Pin
Stainless Steel AISI 303

INFORMATION

With their attractive design, hinges GN 138 are suitable for use in plant and machinery where a well-designed and stylish appearance is important.
The concealed and tamper-proof mounting from the rear highlights and enhances the special appearance of the hinge.
The dimensions l_1 / l_2 and the drill hole spacings m_1 / m_2 match the usual hinges GN 237 (see page 1386) / CFM. (see page 1382) and can replace these.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Load rating information of hinges (see page A40)
- List of hinges types (see page 1362)

Hinges

Technopolymer

MATERIAL
High-resilience polyamide based (PA) technopolymer, black colour, matte finish.

ROTATING PIN
AISI 303 stainless steel.

STANDARD EXECUTIONS
- **CFE-B**: nickel-plated brass bosses with threaded hole.
- **CFE-p**: nickel-plated brass threaded studs.
- **CFE-CH**: pass-through holes for cylindrical head screws.
- **CFE-B-p**: nickel-plated brass bosses with threaded hole and nickel-plated brass threaded studs.
- **CFE-B-CH**: nickel-plated brass bosses with threaded hole and pass-through holes for cylindrical head screws.
- **CFE-p-CH**: nickel-plated brass threaded studs and pass-through holes for cylindrical head screws.

APPLICATIONS
This hinge has been developed in particular for doors provided with gaskets.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 200° (-80° and +120° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

Suggested tightening torque for assembly screws.

Hinges for thin doors

Technopolymer

MATERIAL
High-resilience polyamide based (PA) technopolymer, black colour, matte finish.

ROTATING PIN
AISI 303 stainless steel.

STANDARD EXECUTIONS
- **CFF-B**: nickel-plated brass bosses with threaded hole.
- **CFF-p**: nickel-plated steel threaded studs.
- **CFF-B-p**: nickel-plated brass bosses with threaded hole and nickel-plated steel threaded studs.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 200° (-10° and +190° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

Hinges for profiles

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black or grey colour RAL 7040 (C33), matte finish.

ROTATING PIN
Nickel-plated steel.

STANDARD EXECUTION
Pass-through holes for M6 countersunk head screws.

TECHNOPOLYMER CENTERING INSERTS (SUPPLIED)
For profiles with slot dimensions from 6 to 12 mm.

FEATURES AND APPLICATIONS
This type of hinge can be used with aluminium profiles from 30 up to 60 mm, also combining different dimensions.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 280° (-100° and +180° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

Double hinges for profiles

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black or grey colour RAL 7040 (C33), matte finish.

ROTATING PINS
Nickel-plated steel.

STANDARD EXECUTION
Pass-through holes for M6 countersunk head screws.

TECHNOPOLYMER CENTERING INSERTS (SUPPLIED)
For profiles with slot dimensions from 6 to 12 mm.

FEATURES AND APPLICATIONS
This type of hinge is recommended when, for example, one central frame is connected with two lateral doors. It can be used with aluminium profiles from 30 up to 60 mm, also combining different dimensions.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 260°/275° (-95° and +165°/180° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

Hinges

Accessory for profile systems / Zinc die casting

SPECIFICATION

Zinc die casting
plastic coated
black, textured finish

Pin
Stainless Steel AISI 303

INFORMATION

Hinges GN 161 have been designed for commercially available profile rails.
With three different types of hinges only, 66 different groove distances „n" can be accommodated. To achieve this the positioning elements are set in specially marked recesses in the hinge wings.
The rectangular (8x10 mm) positioning elements, two pieces per hinge wing, will prevent a misalignment. They will also carry the weight of the door.
For screwing the hinges onto the profile rails, special T-Nuts are used.

TECHNICAL INFORMATION

- Load rating information (see page A40)
- Stainless Steel characteristics (see page A26)
- List of hinges types (see page 1362)

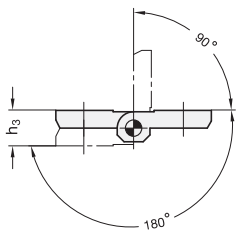
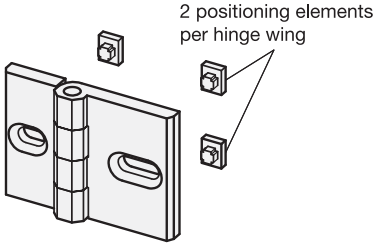
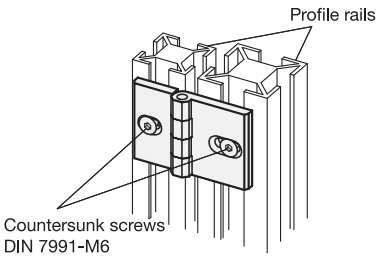
Swivelling range



Assembly instruction



Application example



Hinge for thin doors

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ROTATING PIN
AISI 303 stainless steel.

STANDARD EXECUTION
Pass-through holes for M6 countersunk head screws and referring pins for an accurate positioning of the hinge body.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 200° (-10° and +190° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

ASSEMBLY INSTRUCTIONS
1. Remove the rotation pin and fit the two separated bodies of the hinge on the door and on the frame.
2. Assembly the two elements together matching the right alignment of the hinge and insert the rotation pin.

FM design

Suggested tightening torque for assembly screws.

Thin hinge

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ROTATION PIN AND END-CAPS
Acetal resin based (POM) technopolymer.

STANDARD EXECUTION
Pass-through holes for self-tapping countersunk head screws diameter 4.8 mm.

FEATURES AND APPLICATIONS
Completely made of technopolymer and without metal parts, the hinge is suitable for application on machines and equipment in those sectors where laws or particular hygienic, climatic and environmental factors make it mandatory to use corrosion resistant materials.
By replacing the technopolymer rotation pin with a metal one with an appropriate form, the hinge is suitable to control a safety micro switch mounted on the structure where the hinge is situated.

ROTATION ANGLE (APPROXIMATE VALUE)
CFC. hinges have a max rotation angle of 325°. Depending on the type of assembly, the rotation angle of the door can be lower.
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

In line lift-off hinges

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

AJUSTABLE PIN WITH OCTAGONAL SLOT
Acetal based (POM) technopolymer, black colour.

STANDARD EXECUTIONS
- **CFN-B**: nickel-plated brass bosses with threaded hole.
- **CFN-p**: nickel-plated steel threaded studs.
- **CFN-B-p**: nickel-plated brass bosses with threaded hole and nickel-plated steel threaded studs.
- **CFN-p-B**: nickel-plated steel threaded studs and nickel-plated brass bosses with threaded hole.

FEATURES
CFN. in line lift-off hinges (ELESA patent) have been designed to adjust possible misalignments between the door and the frame.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

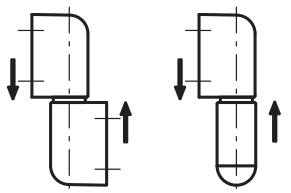
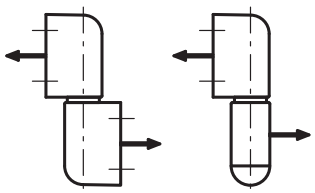
Resistance tests			
AXIAL STRESS		RADIAL STRESS	
			


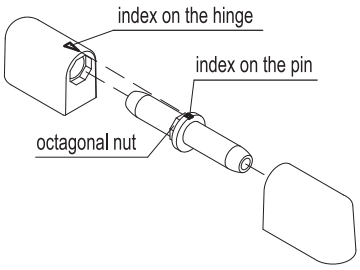


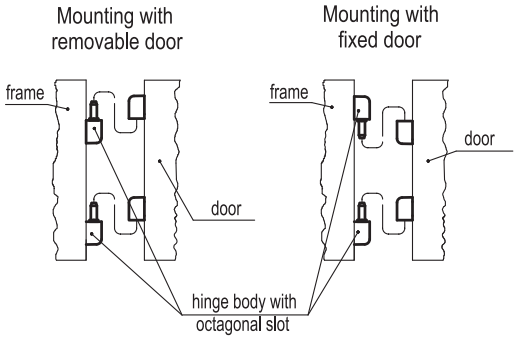
Parallel planes	Perpendicular planes	Parallel planes	Perpendicular planes
Maximum working load Ea [N]		Maximum working load Er [N]	
590		200	

The elastic deformation, which occurs on the hinge for values of load exceeding the ones indicated in the table, makes the load at breakage meaningless.

ASSEMBLY INSTRUCTIONS

1. Fit the hinge bodies with octagonal slot on the frame and the other two bodies with cylindrical slot on the door.
2. Insert the pins with octagonal slot in the two bodies fitted on the frame by matching the indexes engraved on the pin and on the hinge.
3. Mount the door by matching the hinge bodies on the pins.





OFF LINE ADJUSTMENTS

The pin has an octagonal slot which allows different positions for the adjustment of off line door (fig. 1-2-3-4). To have the door in line with the frame, it can be necessary to adjust the pins of both hinges.

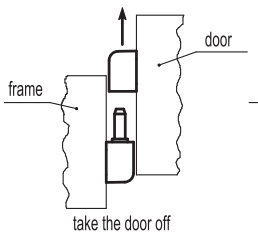


fig.1

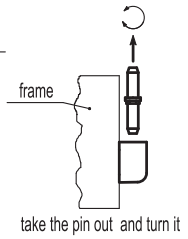

fig.2

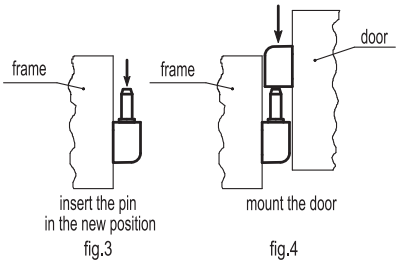

fig.3 fig.4

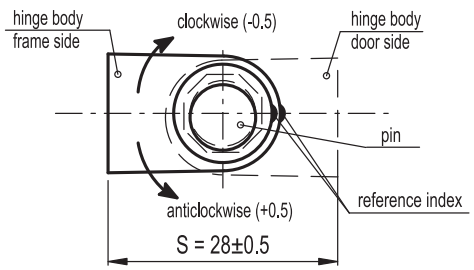
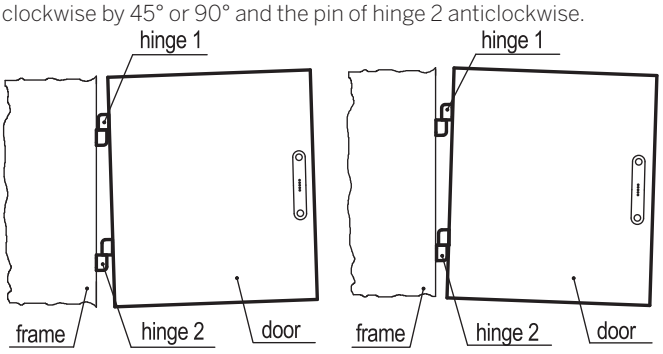
ADJUSTMENT OF THE DOOR

In case the door is off line with the frame, the inclination of the door can be adjusted by turning the octagonal slot of the pins clockwise or anticlockwise.
By turning the pin anticlockwise, the distance S increases (+0.5) while by turning the pin clockwise, it decreases (-0.5).



ADJUSTMENT EXAMPLES

If the door is off line on the bottom side.
In order to have the door in line with the frame, turn the pin of hinge 1 anticlockwise by 45° or 90° and the pin of hinge 2 clockwise.
If the door is off line on the top side.
In order to have the door in line with the frame, turn the pin of hinge 1 clockwise by 45° or 90° and the pin of hinge 2 anticlockwise.



Offset lift-off hinge

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

AJUSTABLE PIN WITH OCTAGONAL SLOT
Acetal based (POM) technopolymer, black colour.

SCREW-COVERS
Polyester based (PBT) technopolymer, black colour, glossy finish, snap-in assembly.

COVERS FOR PIN SLOT
Technopolymer, black colour, matte finish; to be fitted after assembly.

HINGE ASSEMBLY ON FRAME AND DOOR
Pass-through holes for hexagonal head screws, cylindrical head screws with hexagon socket or M5 hexagonal nuts (UNI 5588).

FEATURES AND APPLICATIONS
CFO. offset lift-off hinges (ELESA patent) have been designed to adjust possible misalignments between the door and the frame.
They can be mounted on doors which open on the right or on the left side. Each body of the hinge has a slot for fitting the pin: the opposite side can be closed with the supplied cover.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

SPECIAL EXECUTIONS ON REQUEST
Screw-covers in different RAL colours.

FM design

GN 161.1

Hinges

detachable / zinc die casting

SPECIFICATION

Zinc die casting
plastic coated
black, RAL 9005, textured finish **SW**
silver, RAL 9006, textured finish **SR**

INFORMATION

Hinges GN 161.1 are a variant with highly attractive design. The fixing screws are invisible.
During the load tests, the hinges were gradually loaded and relieved at room temperature with incrementally increasing force.
For the specified values, an insignificant permanent deformation remained after relieving the load which had no effect on the function and appearance. In most cases, the failure loads are multiples of the specified value.
The details relating to the load bearing capacity are non-binding recommended values and rule out any liability. They constitute no general warranty of quality and condition.
The user must determine from case to case whether a product is suitable for the intended use. Environmental influences and aging may influence these values.

- Type **MS**: with fixed brass pin
- Type **STL**: with loose steel pin
- Type **STS**: with fixed steel pin and lubricating nipple

Steel, blank

Pin

- Steel, blank (Types ST / STS / STL)
- Brass, turned, blank (Type MS)

Washer
Brass

Lubricating nipple DIN 71412-D
Steel, zinc plated

INFORMATION

Hinges GN 128 are produced from drawn weldable profiled steel extrusions.
Types ST, STS and MS feature a hinge pin fixed in the lower half of hinge. Type STL with loose steel pin allows the easy installation when attaching several hinges in parallel or if the door is very heavy.
The upper half of Type STS hinge has an additional lubricating nipple DIN 71412-D which allows the hinges to be lubricated without dismantling the hinges.

Hinges with snap-in positions

screw-covers, technopolymer

MATERIAL
Acetal resin based (POM) technopolymer, black colour, matte finish.

ROTATING PIN
Acetal based (POM) technopolymer, black colour.

SCREW-COVERS
Polyester based (PBT) technopolymer, black colour, matte finish, snap-in assembly.

STANDARD EXECUTIONS
- **CFP-SH**: pass-through holes for countersunk head screws.
- **CFP-CH**: pass-through holes for cylindrical head screws.
- **CFP-EH**: pass-through holes for hexagonal head screws.

ROTATION ANGLE (APPROXIMATE VALUE)
- Max 195° (-15° and +180° being 0° the condition where the interconnected surfaces are on the same plane).
- Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
- This hinge can be used combined with the hinge type CFQ. with the same design, without detent position.
- The detent device (ELESA patent) allows four different detent positions of the door (0°, +80°, +120°, +170°).
- To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

RESISTANT TORQUE
All detent positions guarantee a resistant torque of about 1.1 Nm (which is the torque that must be applied to free the detent device of the hinge).
The hinge had been tested with more than 10.000 opening and closing cycles and the value of the resistant torque was unchanged.

Suggested tightening torque for assembly screws.

Hinges with snap-in positions

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

ROTATING PIN
AISI 303 stainless steel.

STANDARD EXECUTIONS
- **CFV-SH**: pass-through holes for countersunk head screws.
- **CFV-EH**: pass-through holes for hexagonal head screws.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 210° (-90° and +120° being 0° the condition where the interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
The detent device (ELESA patent) allows four different detent positions of the door (-90°, 0°, +70°, +115°).
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

RESISTANT TORQUE
All detent positions guarantee a resistant torque of about 3 Nm (which is the torque that must be applied to free the detent device of the hinge).
The hinge had been tested with more than 20.000 opening and closing cycles and the value of the resistant torque was unchanged.

Hinges with adjustable friction

Technopolymer

MATERIAL
Acetal based (POM) technopolymer. Flammability class UL94-HB.

PIN
Polycarbonate based (PC) technopolymer, black colour (white for CLEAN execution). Flammability class UL94-V2.

ADJUSTING BOSS AND SCREW
AISI 304 stainless steel screw.
AISI 303 stainless steel adjusting boss.

STANDARD EXECUTIONS
Assembly by means of pass-through holes for cylindrical head screws.
- **CFU**: black colour, matte finish.
- **CFU-CLEAN**: white colour similar to RAL 9002, matte finish.

FEATURES AND APPLICATIONS
The main feature of CFU. hinge is the possibility to adjust the resistant torque of the door on which it is assembled, facilitating the door clamping in the various positions of opening, partial opening and closing.
To adjust the friction force, simply turn the screw on the hinge body, clockwise to increase the friction and anti-clockwise to reduce it.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 275° (-95° and +180° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.

RESISTANT TORQUE
The resistant torque values of 1.4 and 4 Nm can be obtained by applying a maximum tightening torque of 0.8 Nm (CFU.40) and 4 Nm (CFU.60) on the adjusting screw.
The hinge had been tested with more than 60.000 opening and closing cycles and the values of the resistant torque was unchanged.
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

GN 437

Hinges

with adjustable friction / zinc die casting

SPECIFICATION

Type

Type **A**: 2x2 bores for countersunk screws

Zinc die casting **ZD**
plastic coated
black, RAL 9005, textured finish **SW**
silver, RAL 9006, textured finish **SR**

Friction cone
Plastic (Polyacetal POM)
temperature resistant up to 80 °C

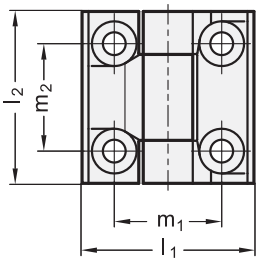
Set screw / Hexagon nut
Steel zinc plated, blue passivated

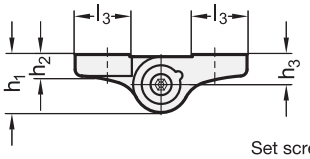
INFORMATION

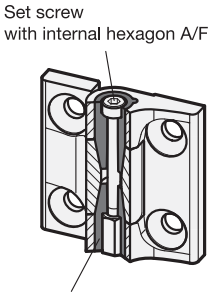
The setscrew in the hinges GN 437 allows the mobility of the hinge to be changed. This also generates a constant braking torque adjustable across the whole of the rotating range. The rotation of doors and flaps is so inhibited, also preventing the inadvertent movement.
The friction torque is accomplished by interlocking two slim friction cones. The large friction surface and the hard-wearing plastic of the friction cones guarantee a long service life with virtually constant stiffness.
Owing to the structure and the prestress of the friction cones, the hinge has virtually no radial play and no play at all in axial direction.

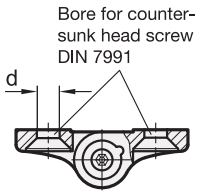
TECHNICAL INFORMATION

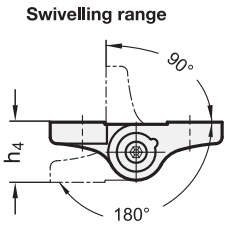
- Load rating information of hinges (see page A40)
- Plastic characteristics (see page A2)
- List of hinges types (see page 1362)

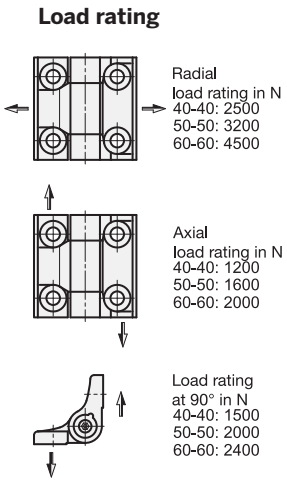












GN 437

Hinges
with built-in safety switch

SUPER-technopolymer

MATERIAL

- **Hinge body**: self-extinguish high-rigidity SUPER-technopolymer, black or grey colour RAL 7040 (C33).
- **Rotation pin**: glass-fibre reinforced polyamide-based tecnopolymer (PA), black or grey colour RAL 7040 (C33).
- **Assembly kit** (see assembly instructions):
  - n°4 technopolymer covers (fig.3).
  - n°4 technopolymer bushings (fig.4 and fig.5).
  - n°2 thermoplastic elastomer safety plugs (fig.7) to guarantee IP67 protection class.
- **Switch**: four slow action electrical contacts with double interruption Zb shaped (see IEC EN 60947-5-1) wich can be set in normally open (NO) or normally closed (NC) mode in production.

Positive opening in compliance with IEC EN 60947-5-1 annex K: the separation of the electrical contacts is the direct result of an actuator action on which an action force is applied by means of non elastic elements, that is to say not dependant on, for example, spring-like elements.

The contact elements guarantee a self-cleaning action of the silver-alloy pastes.

Thanks to its housing made out of SUPER-technopolymer, the CFSW hinge guarantees the double insulation of the internal circuits, therefore there is no need of grounding connection. Furthermore, the housing protects the electric contacts from shocks, atmospheric agents and accidental penetration of tools.

STANDARD EXECUTIONS

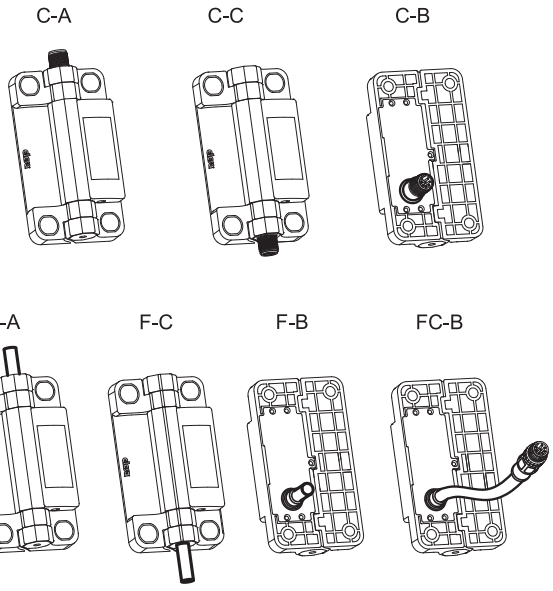
CFSW. hinge must be mounted with the side containing the microswitch on the fixed part (frame structure) and the other side on the movable part (door). The executions shown below refer to the hinges with the micro-switch on the right side.

- **C-A**: 8 pole male connector, top axial output.
- **C-C**: 8 pole male connector, bottom axial output.
- **C-B**: 8 pole male connector, back output.
- **F-A**: 2 or 5 m cable, 8 conductors, top axial output.
- **F-C**: 2 or 5 m cable, 8 conductors, bottom axial output.
- **F-B**: 2 or 5 m cable, 8 conductors, back output.
- **FC-B**: 0,2 m cable, with 8 pole male connector, back output.

Cable type: UL/CSA STYLE 2587 8 X AWG 22.

Contact blocks in the standard execution:

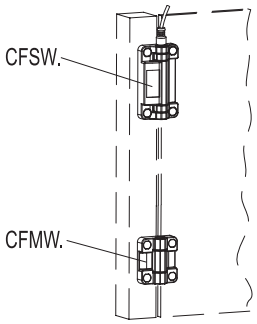
- **NO-NC-NO-NC**: 2 NO contacts + 2 NC contacts.
- **NO-NC-NC-NC**: 1 NO contact + 3 NC contacts.



ELESA Original design

FEATURES AND APPLICATIONS

- Hinge with built-in multiple switch (ELESA patent) is a safety device because in case of accidental opening of doors, machine protections, or safety doors on machines and production equipment, it automatically breaks off the power supply hence protecting the operators.
- This hinge can be subject to frequent cleaning cycles and can be used in any situation or environment where a special attention to cleaning and hygiene is requested, thanks to the IP67 protection class and the use of stainless steel elements for closing the hinge body.
- Limited size, different assembly and output options (cable/connector) make this product easy to install on the most common aluminium profiles (30 mm minimum wide).
- Easy to assemble: the built-in safety multiple switch and the hinge come in one piece offering a very easy and fast assembly. This is a big advantage in comparison with some traditional systems which require to set up separately a hinge and a safety switch connected by a special pin to replace the standard pin of the hinge.
- Universal usage: CFSW. hinges can be assembled on the most common aluminium profiles.
- By using a redundant system, the CFSW hinges allow to have a system design up to SIL3 in compliance with IEC 62061, PLe in compliance with EN ISO 13849-1 or security category 4 in compliance with EN 954-1 with redundant structure.



ACCESSORIES ON REQUEST
- FC.M12x1: extensions with 8 pole M12 female axial connector.
- PMW. (see page 1433): assembly plate on T-slot profiles.

SPECIAL EXECUTIONS ON REQUEST
- Operating angle of the hinge other than from 0° to 180°, every 15°, where the system frame/door requires a special execution.
- NC and NO contact blocks setting (up to 4 NC).
- NO and NC ovelapping contacts.

ASSEMBLY INSTRUCTIONS
CFSW. hinge can be assembled in three different modes:
- With M6 UNI 5933 ISO 10642 countersunk-head screw (not supplied) and screw cover supplied in the kit (fig. 3) to avoid free access to screws.
- With cylindrical-head screw with hexagon socket M6 UNI 5931 ISO 4762 (not supplied) to set with the bushing supplied in the kit (fig.4).
- With M6 UNI 5588 ISO 4032 nut (not supplied) and the bushing supplied in the kit (fig.5). This kind of assembly makes the hinge totally tamper-proof preventing any tampering.
- Fit the hinge side with the built-in microswitch on the fixed part (the frame) and the other side on the door.
- Leave the least clearance between the holes in the mounting walls and the diameter of the setscrews (Max 0.5 mm). The suggested tightening torque should not be exceeded: 5 Nm.
- The hinge must not be used as a mechanical end-stroke either for door maximum opening or for closed door. For this purpose we recommend using external mechanical stops to prevent the door from opening completely against the hinge body assembled on the frame (fig.1) or exceeding the angle where the two interconnected surfaces are on the same plane (fig.2).
- CFSW. hinge is generally assembled with one or more complementary hinges CFMW. (on page 1434) . In case of horizontal door opening or of a limited weight it is possible to use one hinge only.
- The connection cables must always be protected against mechanical damages.

CONTACTS AND CABLES
The built-in safety switch is available with 4 contacts which can be set in production in the normally closed NC or normally open NO mode.
- NC contact with positive opening is mainly used for safety applications. The use of more than one NC switches reduces the risk of error of the single commutation.
- NO contact can be used simultaneously with the NC contact thanks to their electrical separation. The use of NO together with NC contacts guarantees a safety diversification.
- Cable with M12x1 connector following the shown circuit scheme.

ROTATION ANGLE (APPROXIMATE VALUE)
Max 180° (0° and +180° being 0° the condition where the two interconnected surfaces are on the same plane fig.1). The switching angle (see Built-in safety multiple switch functioning and maintenance) is guaranteed from this position. The condition where the two interconnected surfaces are on the same plane is to be strictly verified because the hinge must not be stressed by any negative angle (fig. 2).

Cable/connector/extension* wiring

Approved by IMQ CA02.04800
In compliance with: EN 60947-1/2007+ EN 60947-5-1 : 2004 + A1/2009
Low voltage control auxiliaries
Approved by UL: E360222

Double insulation

Positive opening in compliance with EN 60947-5-1

Category of usage (values approved by IMQ)		**CFSW-C..** (connector)	**CFSW-F..** (cable)
AC15 standard IEC 60947-5-1 Typical applications: electromagnetic load controls in alternating current	24 V	-	4 A
	120 V	-	4 A
	250 V	-	4 A
	400 V	-	4 A
DC13 standard IEC 60947-5-2 Typical applications: electromagnet controls in direct current	24 V	2 A	2 A
	125 V	-	0.4 A
	250 V	-	0.3 A

Remark: the category of usage AC 15 2A 24V may be applied to CFSW-C.., even though this category is not certified by IMQ, since it is not provided for the standards in use.

BUILT-IN SAFETY MULTIPLE SWITCH FUNCTIONING AND MAINTENANCE

- The operating angle (see travel diagram) is set at 5° (we suggest to check it according to UNI EN ISO 13857).
- To guarantee the safety protection function, the hinge must be able to turn at least by 11° (see travel diagram), equivalent to the forced opening of the NC contacts by the actuator (positive opening).
- The adjustment of the operating angle can be modified, in case of doors with large dimensions, till 1° of width before the start up of the hinge by means of a screwdriver turning the assembly screw clockwise (fig.6).

After the adjustment is done, the safety plug must be fit (not removable) to guarantee protection class IP67 (fig.7).
The functioning points shown in the travel diagram undergo the same variation as the operating angle (ex: operating angle 1°, positive operating angle 7°).
Under normal conditions of use, when the mechanical life of the device is over, the operating angle can get to 3° from the starting angle.

- We suggest to check prior to the start up and then periodically the proper functioning of the CFSW. hinge.

When the protection is opened the machine must immediately stop. When the protection is opened at any degrees, the machine must not be able to start.

WARNINGS

- The choice and use of CFSW. hinge is the responsibility of the customer who will check that the relevant application is compliant to the safety regulations in force in the actual operating conditions.
- Using CFSW. hinges always implies a full knowledge of and compliance with the safety regulations in force, including UNI EN ISO 13849-1, IEC EN 60204-1, UNI EN ISO 14119 and EN ISO 12100.
- The hinge must always be assembled and connected by qualified operators who have to check regularly the hinge perfect functioning.
- The hinge with built-in safety switch CFSW. must not be used in environments with frequent temperature changes which can cause condensation, in the presence of explosive or flammable gasses and must always be protected by a proper fuse (see Electrical features table).
- The structure of CFSW hinge must not be modified and the back cover has never to be removed: an improper installation or tampering of the hinge with built-in safety switch can make the protection ineffective and cause serious damages.
- During handling and storage the shown environmental conditions have to be observed.

Category of usage (values approved by UL)	**CFSW-F-A CFSW-F-C CFSW-F-B** (cable)			**CFSW-C-A CFSW-C-C CFSW-C-B** (connector)

Suggested tightening torque for assembly screws.

Resistance tests	AXIAL STRESS	RADIAL STRESS	90° ANGLED STRESS
			Description	Max limit static load Sa [N]	Max limit static load Sr [N]	Max limit static load S90 [N]
CFSW.110	2100	2800	1300

For CFSW. hinges with built-in safety multiple switch, the reference value supplied is the max limit static load (Sa, Sr, S90), since these hinges can be used as safety devices. Above this value, the material may break, thus prejudicing the hinge functionality. Obviously a suitable factor, according to the importance and safety level of the specific application, must be applied to this value. The load values shown in the tables of the different hinges are the result of tests carried out in our laboratories under controlled temperature and humidity (23°C-50% R.H.), under given conditions of use and for a limited period of time.

Example of suitability check

P = weight of the door [N]
P_1 = additional extra load [N]
W = width of the door
D = distance [metres] between the centre of gravity of the door and the hinge axis. In normal conditions D = W/2
D_1 = distance [metres] between the hinge axis and the additional extra load application point
N = number of hinges
k = safety factor
d_T = sum of the distances (metres) of all the hinges from the hinge of reference ($d_T = d_1 + d_2 + ... + dn$). In case of only two hinge assembled, d_T is simply the distance between them.

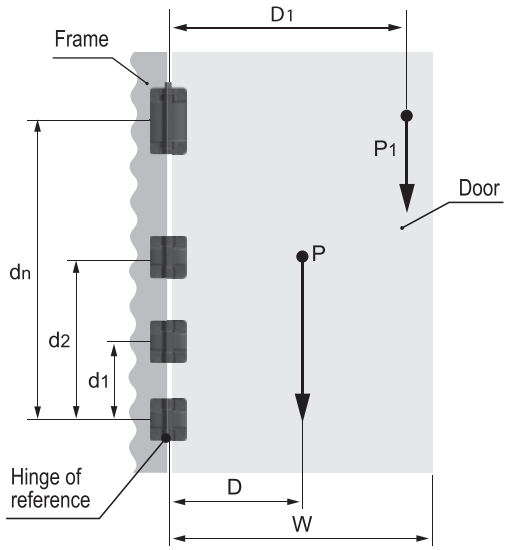
Conditions to be checked in order to ensure a correct functioning with two or more hinges.

$$\frac{(P+P1)}{N} \cdot k < Sa$$

$$\frac{[(P \cdot D)+(P1 \cdot D1)]}{d_T} \cdot k < Sr$$

$$\frac{[(P \cdot D)+(P1 \cdot D1)]}{d_T} \cdot k < S90$$

Hinged door on a vertical axis



The technical designer must use suitable safety factors (k) according to the type of application and function of the CFSW. hinge.

Example hinge CFSW.110-6-2NO+2NC-C-A

P = 294 N (30 Kg) D = 0,4 m N = 3
d_T = 1,5 m d_2 = 1 m d_1 = 0,5 m
P_1 = 196 N (20 Kg) D_1 = 1,2 m

$$\frac{490}{3} = 163 \cdot k < 2100$$

$$\frac{[(294 \cdot 0,4)+(196 \cdot 1,2)]}{1,5} = 235,2 \cdot k < 2800$$

$$\frac{[(294 \cdot 0,4)+(196 \cdot 1,2)]}{1,5} = 235,2 \cdot k < 1300$$

The examples shown here must be considered only as explanatory, since they are not applicable to all the different applications, conditions of use, ways of assembly which can actually take place. In practice, the technical designer, after applying a suitable safety factor (k) must also test the chosen product to check its suitability.
For further general technical information, refer to the guidelines.

CFSW. and CFMW. assembly kit for profiles

SUPER-technopolymer

PLATE
Glass-fibre reinforced polyamide (PA) SUPER-technopolymer, black colour, matte finish.

SCREWS AND NUTS
AISI 304 stainless steel.

FEATURES AND APPLICATIONS
PMW assembly plate allows the mounting of CFSW.110 and CFMW.110 hinges on standard profiles of 30, 35, 40, 45 and 50 mm with T-slot.
The mounting on profiles of 40 mm can also be performed without the use of assembly plate.
The fixing screws of the plate to the profile are not accessible after the assembly of the hinges (Fig. 1). Therefore, even with the use of PMW assembly plate, CFSW. and CFMW. hinges remain tamperproof.
The supply of the plate includes:
- 2 countersunk screws M6x12 (for CFSW.110).
- 2 countersunk screws M6x14 (for CFMW.110).
- 2 M6 hexagonal nuts, assembled into the plate, necessary for the fixing of the hinge to the plate.

Plates of different dimensions can be combined in case of door and doorframe made with profiles of different dimensions (Fig.2).

ASSEMBLY INSTRUCTIONS
- Fix the plate on the profile in the desired position by using M6 countersunk head screws (not included in the supply) and the relative dowels for T-slot type GN 505 (see page 979) (not included in supply).
- Fit CFSW.110 or CFMW.110 hinge (fig. 1) on the relative plate by using M6 countersunk head screws (included in the supply).
- Place the closing caps properly (included in the supply of the hinge).

TECHNICAL DATA
The use of PMW plate, properly assembled as indicated in the assembly instructions, guarantees the max limit static load of CFSW. and CFMW.

ELESA Original design

51907	PMW.110-50	50	34	69	24	28

Hinges

SUPER-technopolymer

MATERIAL
Glass-fibre reinforced polyamide (PA) SUPER-technopolymer, black or grey colour RAL 7040 (C33), matte finish.

ROTATING PIN
Glass-fibre reinforced polyamide based (PA) technopolymer, black or grey colour RAL 7040 (C33).

ASSEMBLY KIT (SEE ASSEMBLY):
- n°4 technopolymer covers (fig.1).
- n°4 technopolymer bushings (fig.2 and fig.3).

MOUNTING
CFMW. hinge can be assembled in three different modes:
- With M6 UNI 5933 ISO 10642 countersunk-head screw (not supplied) and screw cover supplied in the kit (fig. 1) to avoid free access to screws.
- With cylindrical-head screw with hexagon socket M6 UNI 5931 ISO 4762 (not supplied) to set with the bushing supplied in the kit (fig.2).
- With M6 UNI 5588 ISO 4032 nut (not supplied) and the bushing supplied in the kit (fig.3). This kind of assembly makes the hinge totally tamper-proof preventing any tampering.

FEATURES AND APPLICATIONS
The different assembly options make this product easy to install on the most common aluminium profiles (30 mm minimum side).
CFMW. hinge can be assembled with CFSW. hinge with built-in safety switch. CFSW. (see page 1428).

ROTATION ANGLE (APPROXIMATE VALUE)
Max 180° (0° and +180° being 0° the condition where the two interconnected surfaces are on the same plane).
Do not exceed the rotation angle limit so as not to prejudice the hinge mechanical performance.
The condition where the two interconnected surfaces are on the same plane is to be strictly verified because the hinge must not be stressed by any negative angle (fig.4).
To choose the convenient type and the right number of hinges for your application, see the Guidelines (on page 1368).

Suggested tightening torque for assembly screws.

Hinges with built-in safety switch

SUPER-technopolymer

MATERIAL

Self-extinguish high-rigidity SUPER-technopolymer, black colour, matte finish.
Thanks to its housing made out of SUPER-technopolymer, the CFSQ hinge guarantees the double insulation of the internal circuits, therefore there is no need of grounding connection. Furthermore, the housing protects the electric contacts from shocks, atmospheric agents and accidental penetration of tools.

ROTATING PIN

AISI 303 stainless steel.

STANDARD EXECUTIONS

Assembly by means of pass-through holes for M6 countersunk-head screws UNI 5933, DIN 7991.
Starting work angle 0°:
- **C-A-D**: axial connector, microswitch on the right.
- **C-A-S**: axial connector, microswitch on the left.
- **C-B-D**: rear connector, microswitch on the right.
- **C-B-S**: rear connector, microswitch on the left.
- **F-A-D**: axial cable, 2 or 5 m length, microswitch on the right.
- **F-A-S**: axial cable, 2 or 5 m length, microswitch on the left.
- **F-B-D**: rear cable, 2 or 5 m length, microswitch on the right.
- **F-B-S**: rear cable, 2 or 5 m length, microswitch on the left.

Starting work angle -90°:
- **C-A-D-EA**: axial connector, microswitch on the right.
- **C-A-S-EA**: axial connector, microswitch on the left.
- **C-B-D-EA**: rear connector, microswitch on the right.
- **C-B-S-EA**: rear connector, microswitch on the left.

Cable type: UL/CSA STYLE 2587 3 X AWG 22.

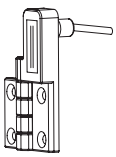
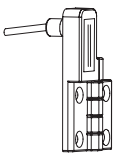
CFSQ-F-B-D



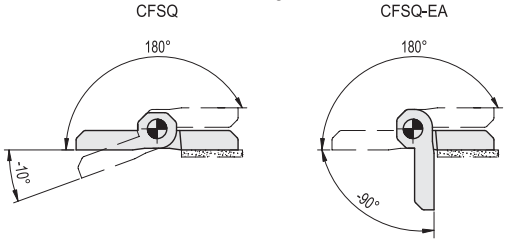
CFSQ-F-B-S



ROTATION ANGLE (APPROXIMATE VALUE)

CFSQ: max 190° (-10° and +180° see Fig.1).
CFSQ-EA: max 270° (-90° and +180° see Fig.1).
0° is the condition where the interconnected surfaces are on the same plane.
See Built-in safety switch functioning and maintenance.
The hinge must not be stressed by any negative angle of less than -10° (CFSQ) and -90° (CFSQ-EA).

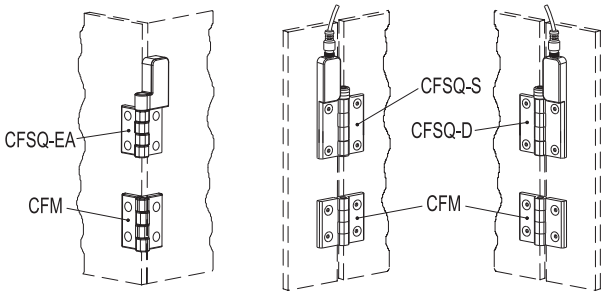
Fig.1



ELESA Original design

FEATURES AND APPLICATIONS

- The hinge with built-in switch (ELESA patent) is a safety device because in case of accidental opening of doors, machine protections, or safety doors on machines and production equipment, it automatically breaks off the power supply hence protecting the operators.
- This hinge can be subject to frequent cleaning cycles and can be used in any situation or environment where a special attention to cleaning and hygiene is requested, thanks to the IP67 protection class and the use of stainless steel elements for closing the hinge body.
- Switch equipped with two contacts: one NC contact and one change-over NO contact, form C, see IEC EN 60947-5-1 standard.
- Switch set with positive opening (in compliance with IEC EN 60947-5-1 standard, K attachment): the contacts break off for the direct movement of an actuator, onto which the working force is applied through non elastic elements.
- Quick release switch: the stroke speed of the contact-holder slider does not depend on the working speed.
- Easy to assemble: the built-in safety switch is integrated into a single body with the hinge, thus offering a very easy and fast assembly. This is a great advantage in comparison with some traditional systems which still require to set up separately a hinge and a safety switch connected by a special pin to replace the standard pin of the hinge.
- Universal usage: CFSQ hinges can be assembled on the most common aluminium profiles.



ACCESSORIES ON REQUEST
- FC.M12x1: extensions with 4 pole M12 female axial connector.

SPECIAL EXECUTIONS ON REQUEST
Operating angle of the hinge other than from 0° to 180°, every 15°, where the system frame/door requires a special execution.

ASSEMBLY INSTRUCTIONS
- Fit the hinge body with the built-in switch on the fixed part (frame) and the other body on the door. The distance between the axis of the hinge pin and the door must be at least 5 mm (fig.3).
- Leave the least clearance between the holes in the mounting walls and the diameter of the setscrews (Max 0.5 mm). The suggested tightening torque should not be exceeded: 5 Nm.
- The hinge must not be used as a mechanical end-stroke either for door maximum opening or for closed door. For this purpose we recommend using external mechanical stops to prevent the door from opening completely against the hinge body assembled on the frame or exceeding the angle where the two interconnected surfaces are on the same plane.
- The CFSQ hinge must always be assembled with at least a second complementary hinge CFM. (CFM.60-45- SH-6 code 425812). In case of horizontal door opening or in general of a limited weight it is possible to use one hinge only.
- The connection cables must always be protected against mechanical damages.

CABLES
- Cable with M12x1 connector using the following circuit scheme.
- Normally Closed contact NC: for safety applications, according to IEC EN 60947-5-1 standard, only the NC contact (for break off) must be used leaving the NO contact unused.
- Normally Open contact NO: the normally open contact can be used only if the hinge is used as status indicator (signalling) in this case also the NC contact can be used simultaneously always as status indicator (signalling).

BUILT-IN SAFETY SWITCH FUNCTIONING AND MAINTENANCE
- The angle nominal variation required for switching the microswitch is of 6° (see stroke diagram). In normal conditions of use, when the mechanical life of the device is completed, the nominal variation may increase up to 9 °. We suggest to check the proper functioning of the hinge according to UNI EN ISO 13857.
- For applications with safety protection function, the hinge must be able to turn at least by 15°, equivalent to the forced opening (positive opening) of the contacts by the actuator.
- We suggest to check the proper functioning of the CFSQ hinge prior to the start up and afterwards periodically.
- When the protection is opened the machine must immediately stop. When the protection is opened at any degrees, the machine must not be able to start.

WARNINGS
- The hinge with built-in safety switch must not be used in environments with frequent temperature changes which can cause condensation, in the presence of explosive or flammable gasses.
- The hinge with built-in safety switch must always be protected with a proper fuse (see table).
- The choice and use of the hinge with built-in safety switch is the responsibility of the customer who will check that the relevant application is compliant to the safety standards in force under the actual operating conditions.
- Using CFSQ hinges always implies a full knowledge of and compliance with the safety standards in force, including EN ISO 13849-1, IEC EN 60204-1, UNI EN ISO 14119, EN ISO 12100.
- The hinge must always be assembled and connected by qualified operators who have to check regularly the hinge perfect functioning.

D = distance [metres] between the centre of gravity of the door and the hinge axis. In normal conditions D = W/2
D_1 = distance [metres] between the hinge axis and the additional extra load application point
N = number of hinges
k = safety factor
d_1 ... d_n = distances (metres) of all the hinges from the hinge of reference
$d_T = d_1 + d_2 + ... + d_n$ in case of only two hinges assembled, d_T is simply the distance between them

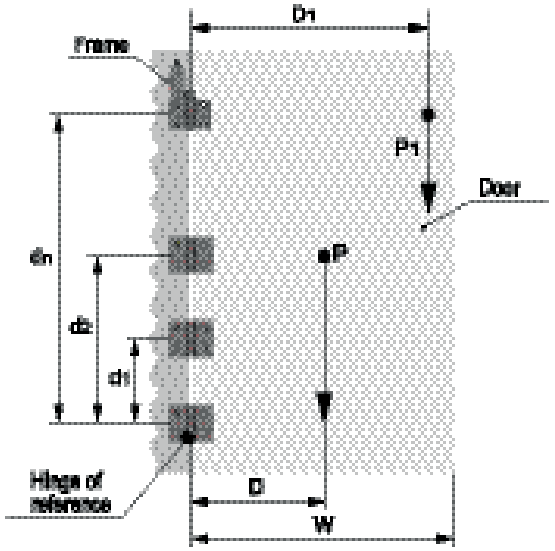
Conditions to be checked in order to ensure a correct functioning with two or more hinges.

$$\frac{(P+P1)}{N} \cdot k < Sa$$

$$\frac{[(P \cdot D)+(P1 \cdot D1)]}{d_T} \cdot k < Sr$$

$$\frac{[(P \cdot D)+(P1 \cdot D1)]}{d_T} \cdot k < S90$$

Hinged door on a vertical axis



The technical designer must use suitable safety factors (k) according to the type of application and function of the CFSQ. hinge.

Example hinge CFSQ.80-SH-6

P = 294 N (30 Kg) D = 0,4 m N = 3
d_1 = 1,5 m d_2 = 1 m d_3 = 0,5 m
P_1 = 196 N (20 Kg) D_1 = 1,2 m

$$\frac{480}{3} = 160 \cdot k < 2100$$

$$\frac{[(294 \cdot 0,4)+(196 \cdot 1,2)]}{1,5} = 235,2 \cdot k < 2800$$

$$\frac{[(294 \cdot 0,4)+(196 \cdot 1,2)]}{1,5} = 235,2 \cdot k < 1300$$

The examples shown here must be considered only as explanatory, since they are not applicable to all the different applications, conditions of use, ways of assembly which can actually take place. In practice, the technical designer, after applying a suitable safety factor (k) must also test the chosen product to check its suitability.
For further general technical information, refer to the guidelines.

Hinges with safety switch

Zinc die casting

SPECIFICATION

Types

- Type **A**: Connector plug at the top
- Type **AK**: Cable at the top
- Type **B**: Connector plug from the bottom
- Type **BK**: Cable from the bottom
- Type **C**: Connector plug on the backside, with 0.2 m cable
- Type **CK**: Cable from the back

Zinc die casting
plastic coated
silver metallic

Pin
Stainless Steel AISI 303

INFORMATION

Hinges GN 139.1 with integrated safety switches have been designed for monitoring doors and covers of machines and plants. Opening the door will activate the switch contacts which, in turn, will then e.g. interrupt a protective circuit via break contact (NC) and at the same time signal the door opening by closing a normally open contact element (NO).
The contact blocks are fitted with positive opening slow-action contacts, i.e. they will definitely be separated when activated and have no hysteresis. The angle at which the switching points are reached are adjustable (see contact travel diagram).
Together with the integrated contact blocks, the hinges are a compact, easy to mount unit with an attractive design. The mounting from the back make the hinge more tamper-proof.

ON REQUEST

- Hinges with operation angle > 0°
- Hinges with other contact terminations

ACCESSORIES

Cable with connection coupling
8-pole, 5 or 10 meters long:

- Cables with conntector coupling GN 330-M12x1-8-G-5 (see page 1448)
- Cables with conntector coupling GN 330-M12x1-8-G-10 (see page 1448)
- Mounting plates, flat GN 139.3 (see page 1444)
- Mounting plates, angled GN 139.4 (see page 1444)

TECHNICAL INFORMATION

- Load rating information of hinges (see page A40)

Other important details and hints are given in the operating instruction for GN 139.1 which is included with every delivery and which is also available as PDF download from „www.elesa-ganter.com“ under ‚Downloads‘.

The hinges with safety switch must be mounted and commissioned by qualified technical personnel in compliance with the details given in the operating instruction and with the national and international rules and regulations and the applicable standards. Elesa+Ganter will assume no statutory liability for missing or incorrect information and for any consequences arising therefrom.

GN 139.2

Hinges without safety switch

Zinc die casting

SPECIFICATION

Zinc die casting
plastic coated
silver metallic

Pin
Stainless Steel AISI 303

INFORMATION

With the exception of the connector plug, hinges without safety switch GN 139.2 do not differ in their external appearance from hinges with safety switch GN 139.1 (see page 1440). With the concealed screw connection at the back, the hinge is also tamper-proof. The compact design combines safety and attractive appearance.
The design with broad hinge halves is intended for mounting to glass or polycarbonate doors.

TECHNICAL INFORMATION

- Load rating information of hinges (see page A40)

Stainless Steel precision casting

- AISI 316L
- polished, Ra < 0.8 µm

Pin
Stainless Steel AISI 316L

INFORMATION

Hinges GN 139.5 with integrated safety switches have been designed for monitoring doors and covers of machines and plants. Opening the door will activate the switch contacts which, in turn, will then e.g. interrupt a protective circuit via break contact (NC) and at the same time signal the door opening by closing a normally open contact element (NO). The contact blocks are fitted with positive opening slow-action contacts, i.e. they will definitely be separated when activated and have no hysteresis. The angle at which the switching points are reached are adjustable.
Together with the integrated contact blocks, the hinges are a compact, easy to mount unit with an attractive design. The mounting from the back make the hinge more tamper-proof. Hinges GN 139.6 (see page 1447) without switching function act as additional hinges, e.g. for larger doors or gates where several hinges are required.

OTHER CABLE PROPERTIES

This adaptable cable, suitable for drag chains, features and outer jacket made of PUR and a core insulation made of polypropylene. It is free of PVC, silicon and halogens. UL and CSA approvals are available.

The cable is also resistant to oil, chemical, hydrolysis, microbes and welding sparks and flame retardant under IEC 60332-2-2 which makes the cable the perfect choice in many applications.

INFORMATION

Hinges GN 129 are used for doors which are flush with the frame on the outside. These hinges are normally arranged to the side of the door.
In the two-part design, the door can be unhinged with two identically arranged hinges.
The three-part hinges, which generally cannot be unhinged and are mounted inside, are suitable for doors and flaps which, as anti-tamper precaution, must not be dismountable from the outside.

GN 129.3

Hinges

consisting of three parts / Steel

SPECIFICATION

Type

Type **A**: Fixing from the front side

Steel zinc plated, blue passivated **ST**

Pin
Brass, nickel plated

Washer
Brass, nickel plated

INFORMATION

Hinges GN 129.3 are used for doors which are flush with the frame on the outside. Once assembled, they cannot be unhinged.
By using cylinder screws DIN 912, they are conveniently fixed using threads on the user side or by using through screws for different clamping thicknesses.

TECHNICAL INFORMATION

- List of hinges types (see page 1362)

GN 129.5

Stainless Steel-Hinges

consisting of three parts

SPECIFICATION

Type

Type **D**: consisting of three parts

Hinge body, pin, washer

- Stainless Steel AISI 303 **NI**
- Stainless Steel AISI 316L **A4**

Hexagon nut ISO 4032
Stainless Steel AISI 304

Serrated washer DIN 6797 for securing screws
Stainless Steel AISI 304

INFORMATION

Stainless Steel-Hinges GN 129.5 are used for doors which are flush with the frame on the outside. Once assembled, they cannot be unhinged.
With the fixing from the inside, they are especially suitable for doors and trap doors which must not be detachable from the outside as an anti-tamper device.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- List of hinges types (see page 1362)

Zinc die casting / Stainless Steel, lockable

SPECIFICATION

Version in Zinc die casting

Types

- Type **SC**: Operation with key (same lock)
- Type **SU**: Operation with key (different lock)
- Type **SCK**: Operation with wing knob (same lock)
- Type **SUK**: Operation with wing knob (different lock)
- Type **SCT**: Operation with T-Handle (same lock)
- Type **SUT**: Operation with T-Handle (different lock)
- Type **LCG**: Operation with hand lever (only in SW), (same lock)
- Type **LUG**: Operation with hand lever (only in SW), (different lock)

Lock housing
Zinc die casting

Locating ring

- chrome plated (standard)
- plastic coated, black, RAL 9005, textured finish **SW**

All other parts
Steel zinc plated, blue passivated

Key
Nickel silver with plastic hand piece

Wing knob / T-Handle
Plastic (Polyamide PA)
black, matt

Version in Stainless Steel

Type

- Type **SC**: Operation with key (same lock)

Lock housing
Stainless Steel AISI 303 **NI**

Latch
Stainless Steel AISI 304

Key
Nickel silver with plastic hand piece

INFORMATION

The lockable latches GN 115 lock by a turning operation limited to 90° which moves the locking behind the door frame. The bevels of the latch ease the closing of the door.
Latches with different cranks cover a latch distance A from 4 to 50 mm.
The types with a different lock are available in more than 200 variants, whose key is marked by numbers.
The scope of delivery includes a separately enclosed latch as well as two keys removable in both end positions.

TECHNICAL INFORMATION

- List of latch types (see page 1456)
- Stainless Steel characteristics (see page A26)
- Plastic characteristics (see page A2)

ACCESSORY

- Protective caps GN 120 (see page 1486)
- Opening handles GN 120.1 (see page 1487)

CONSTRUCTION AND ASSEMBLY INSTRUCTIONS

For installation, set a bore diameter in the door as shown in the outline drawing.
Once assembled, the latch is pushed through the bore diameter from the front. The hexagon nut can then be pushed over the latch from the back and bolted in place.
The **installation bore diameter** in the door leaf is usually generated by punching or laser machining in series production.
For small series and steel sheets below 2 mm thickness, the sheet metal punshes GN 123 (see page 1493) are the tool of choice.
The installation bore diameter can also be set by drilling / milling as shown in the outline drawings.

Protection class IP 65

INFORMATION

Latches GN 115 lock by a turning operation limited to 90° which moves the locking behind the door frame. The bevels of the latch ease the closing of the door.
Latches with different cranks cover a latch distance A from 4 to 50 mm.
The operating bolt of the stainless steel version is fitted with an O-ring for sealing.
Latches GN 115 are supplied with loosely enclosed latch.

TECHNICAL INFORMATION

- List of latch types (see page 1456)
- IP Protection classes (see page A23)
- Stainless Steel characteristics (see page A26)

ACCESSORY

- Socket keys GN 119.2 (see page 1530)
- Protective caps GN 120 (see page 1486)
- Opening handles GN 120.1 (see page 1487)

CONSTRUCTION AND ASSEMBLY INSTRUCTIONS

For installation, set a bore diameter in the door as shown in the outline drawing.
Once assembled, the latch is pushed through the bore diameter from the front. The hexagon nut can then be pushed over the latch from the back and bolted in place.
The **installation bore diameter** in the door leaf is usually generated by punching or laser machining in series production.
For small series and steel sheets below 2 mm thickness, the sheet metal punshes GN 123 (see page 1493) are the tool of choice. The installation bore diameter can also be set by drilling / milling as shown in the outline drawings.

Cabinet "U" handle
Zinc die casting

plastic coated
black, RAL 9005, textured finish **SW**
silver, RAL 9006, textured finish **SR**

other parts
Steel
zinc plated, blue passivated

INFORMATION

Latches with cabinet "U" handle GN 115.7 are used when the application requires both a locking mechanism and a handle.
A rotary movement limited to 90°, e.g. of the triangular spindle of type DK, shifts the key-bolt behind the door frame, with the bevelled key-bolt making the door closing action easier.
Latches with different cranks cover a latch distance A from 4 to 50 mm.
Latches GN 115.7 are supplied with loosely enclosed latch.

TECHNICAL AND ASSEMBLY INSTRUCTIONS

Depending on the installation situation, the 90° rotary movement range of the latch can be defined by means of a plug-type element which can be mounted in 4 different positions.
This allows the latch with cabinet „U" handle to be used in any attachment position and regardless of the turning and locking direction or of the narrow side of the door. Subsequent repositioning of the 90° rotary range is possible.
The drawing below shows the plugging options and the resulting 90° rotary ranges.

For mounting, the door is fitted with two bore holes as shown in the outline drawing, attached at a distance of 30 mm from the door frame.
If preassembled (cabinet „U" handle and latch), the locking mechanism can be pushed through the bore hole from the front. Then turn in the M6 fixing screw from the rear and push and screw on the hexagonal nut over the latch. Both elements can now be tightened.
The spigot (M22x1.5) also has 4 surfaces, with the effect that the cabinet „U" handle can also be used with the standard borehole of the latches GN 115 (see page 1462).

INFORMATION

Hook-type latches GN 115.8 with hook and latch bracket are mainly used for sliding doors and flaps. The locking action is in radial direciton to the axis of rotation, resulting in a wide variety of different uses.
The types with a different lock are available in more than 200 variants, whose key is marked by numbers.
The scope of delivery includes a separately enclosed hook as well as two keys removable in both end positions.

Operation with operating elements, not lockable

Types

- Type **SG**: Operation with star knob
- Type **SK**: Operation with wing knob
- Type **ST**: Operation with T-Handle

ON REQUEST

- Hook-type latches with other hook distance A
- Hook with other pivoting radius R

GN 115.8 | Hook-type latches

CONSTRUCTION AND ASSEMBLY INSTRUCTIONS

The bolt diameter may be shifted by 10 mm, making it easier to adapt the locking mechanism to the installation site.
When locked, the bolt is ideally positioned at the level of the axis of rotation as shown. A sideways offset of as much as 4 mm does not impair the proper function.
The angle of rotation of the **hook** is normally limited to 90°. Depending on the mounting of the contact pin supplied loose, the locking action is effected by turning left or right. Without the contact pin, the hook can be rotated by 360°.
For installation, set a bore diameter in the door as shown in the outline drawing.
Before mounting the hook, the locking mechanism must first be mounted in the door leaf (using the enclosed hexagonal nut).
The **installation bore diameter** in the door leaf is usually generated by punching or laser machining in series production.
For small series and steel sheets below 2 mm thickness, the sheet metal punshes GN 123 (see page 1493) are the tool of choice.
The installation bore diameter can also be set by drilling / milling as shown in the outline drawings.

All other parts
Steel zinc plated, blue passivated

INFORMATION

Latches GN 115.9 have a **push-to-turn** safety function. In the two end positions the spindle is locked in place by the latch. The device can be turned 90° only when the operating element is pressed down, which releases the safety pin from the locked position. This feature protects the latch reliably from moving on its own or as the result of vibrations.
The beveled edges on the latch make closing the door easy. Latches with different cranks cover a latch distance A from 4 to 32 mm.
Latches GN 115.9 are supplied with loosely enclosed latch.

TECHNICAL INFORMATION

- List of latch types (see page 1456)
- Plastic characteristics (see page A2)

ACCESSORY

- Socket keys GN 119.2 (see page 1530)
- Protective caps GN 120 (see page A2)
- Opening handles GN 120.1 (see page 1487)

CONSTRUCTION AND ASSEMBLY INSTRUCTIONS

For installation, set a bore diameter in the door as shown in the outline drawing.
Once assembled, the latch is pushed through the bore diameter from the front. The hexagon nut can then be pushed over the latch from the back and bolted in place.
The **installation bore diameter** in the door leaf is usually generated by punching or laser machining in series production.
For small series and steel sheets below 2 mm thickness, the sheet metal punshes GN 123 (see page 1493) are the tool of choice.
The installation bore diameter can also be set by drilling / milling as shown in the outline drawings.

Protective guide plates

for latches GN 115, GN 115.7, GN 115.10

SPECIFICATION

Types

- Type **A**: Mounting with countersunk screw
- Type **B**: Mounting with adhesive pad

Plastic (Polyamide PA)
black, matt **SW**

Adhesive pad (only type B)
Scotch-Mount ™ 4026
double-sided,
with polyurethane foam backing

INFORMATION

Protective guide plates GN 120.2 are used in connection with door latches, using the principle of friction. They prevent the latch from causing abrasion, for example to corrosion protection layers on a door frame. They additionally prevent unintended opening, as the latches lock into a small recess in their closed position.
If the d_2 positioning tabs are not required they can easily be removed with side cutting pliers, for example.

Latches that can be used together with GN 120.2 protective guide plates:

- Latches, lockable GN 115 (see page 1462)
- Latches, not lockable GN 115 (see page 1465)
- Latches with key GN 115 (see page 1468)
- Stainless Steel-Hygienic latches GN 115 (see page 1471)
- Latches with cabinet "U" handle GN 115.7 (see page 1472)
- Latches with gripping tray GN 115.10 (see page 1527)

Lever latches with fold-away knob

Technopolymer

MATERIAL
Rotor, stator, fold-away knob, closing lever and nut (M22x1.5) in glass-fibre reinforced polyamide based (PA) technopolymer certified self-extinguish UL-94 V0, black colour, matte finish.

PACKING RING
SBR rubber.

INTERNAL TOOTHED WASHER
AISI 304 stainless steel.

SELF-TAPPING SCREW
AISI 304 stainless steel.

ROTATION
90°.

IP PROTECTION
IP 65 protection class, according to table EN 60529 (see page A23).

TECHNICAL DATA
The "V0" certification in accordance with UL-94 V (Underwriters Laboratories) (see Technical Data on page A5) indicates that on a plastic test sample with specific shape and dimensions, in the vertical position, the flame is extinguished within 10 seconds, without generating incandescent drops.

SPECIAL EXECUTIONS ON REQUEST
Closing lever with l2 ledge in other dimensions.

Compression latches with key-type knob

Zinc alloy

MATERIAL
Rotor, stator and knob in nickel-plated zinc alloy.

NUT
M19x1 in brass.

SPRING WASHER
Zinc-plated steel.

WASHER
PVC (only for CML. execution).

CLOSING LEVER
Zinc-plated steel, thickness 2.5 mm.

SCREW
M5x8 zinc-plated steel.

STANDARD EXECUTIONS
- **CM.**: with knob without tranversal hole for the padlock.
- **CML**: with knob provided with a transversal hole for the insertion of a padlock with hook of a diameter from 5 to 7 mm.

ROTATION
90°.

SPECIAL EXECUTIONS AND ACCESSORIES
- Closing levers in other dimensions.
- Brass threaded extension for prolonged positioning of the lever (code 421137 C.PQ M5/58).

Protection class IP 65

INFORMATION

Latches GN 119 have a pulling-in range of 10 mm. Locking is achieved by turning the latch clockwise.
The operating bolt of the stainless steel version is fitted with an O-ring for sealing.

TECHNICAL INFORMATION

- List of latch types (see page 1456)
- IP Protection classes (see page A23)
- Stainless Steel characteristics (see page A26)
- Plastic characteristics (see page A2)

ACCESSORY

- Socket keys GN 119.2 (see page 1530)
- Protective caps GN 120 (see page 1486)
- Opening handles GN 120.1 (see page 1487)

CONSTRUCTION AND ASSEMBLY INSTRUCTIONS

By turning the latch clockwise the stepped cam latch moves up behind the door frame and pulls the door in.
The large pulling-in range of the cam (10 mm) allows these locks to be used successfully on doors with sealing strips. When selecting clamping range ‚A' the thickness of the door seal might have to be taken into consideration.
To fit the lock, the door will have to be provided with a hole as per sketch shown at a distance from the door frame to hole center of 23 mm.
The lock housing with the preassembled operating bolt is fitted into the hole from the front and held in position with the hexagon nut. The distance piece and the cam latch are then fitted at the rear and fixed with the hexagon nut.
In volume production, the **mounting borehole** in the door leaf is usually made by punching or laser machining.
For small series and steel sheets below 2 mm thickness, the sheet metal punches GN 123 (see page 1493) are the tool of choice.
The installation bore diameter can also be set by drilling / milling as shown in the outline drawings.

INFORMATION

Latches with cabinet "U" handle GN 119.3 are used when the application requires both a locking mechanism and a handle.
The cabinet "U" handle with integrated lock is an attractively designed and cost-effective solution.
Latches GN 119.3 have a pulling-in range of 10 mm. Locking is achieved by turning the latch clockwise.

TECHNICAL INFORMATION

- List of latch types (see page 1456)

ACCESSORY

- Socket keys GN 119.2 (see page 1530)

TECHNICAL AND ASSEMBLY INSTRUCTIONS

By turning the latch clockwise the stepped cam latch moves up behind the door frame and pulls the door in.
The large pulling-in range of the cam (10 mm) allows these locks to be used successfully on doors with sealing strips. When selecting clamping range ‚A' the thickness of the door seal might have to be taken into consideration.
To fit the lock, the door will have to be provided with two holes as per sketch shown at a distance from the door frame to hole center of 23 mm.
The spigot (M22x1.5) has 4 surfaces, allowing the cabinet "U" handle also to be used with the standard bore holes of door latches GN 119 (see page 1482).
The lock housing with the preassembled operating bolt is fitted into the hole from the front and held in position with the hexagon nut. The distance piece and the cam latch are then fitted at the rear and fixed with the hexagon nut.

Protective caps

for latches

SPECIFICATION

Plastic (Polyethylene)
black

INFORMATION

Protective caps GN 120 are used in combination with key-actuated locking devices. These prevent dirt from entering the key mechanism and the locking device and can be mounted as required in a 90° grid pattern together with the housing of the locking device.
Please note: The clamping range A1 ... A9 and/or the latch distance A is reduced by the dimension „b".

Protective caps GN 120 are suitable for the following latches:

- Mini-Latches GN 115.1 (see page 1504)
- Mini-Latches GN 115.6 (see page 1505)
- Latches, lockable GN 115 (see page 1462)
- Latches, not lockable GN 115 (see page 1465)
- Hook-type latches GN 115.8 (see page 1474)
- Latches GN 119 (see page 1482)
- Rotary clamping latches GN 516 (see page 1542)
- Rotary clamping latches GN 516.1 (see page 1544)
- Stainless Steel-Rotary clamping latches GN 516.5 (see page 1546)

TECHNICAL INFORMATION

- Plastic characteristics (see page A2)

GN 120.1

Opening handles

for latches

SPECIFICATION

Plastic (Polyamide PA)
black, matt **SW**

INFORMATION

Opening handles GN 120.1 are simple operating elements which are used in combination with key or push-button actuated locking devices. They have a low installation height and can be mounted as required in a 90° grid pattern together with the lock housing.
Please note: The clamping range A1 ... A9 and/or the latch distance A is reduced by the dimension „b".

Opening handles GN 120.1 are suitable for the following latches and locking devices:

- Latches, lockable GN 115 (see page 1462)
- Latches, not lockable GN 115 (see page 1465)
- Hook-type latches GN 115.8 (see page 1474)

Star knob DIN 6336
Plastic (Polyamide PA)
black, matt

Cam latch
Sheet Steel
zinc plated, blue passivated

Bolt and distance piece
Steel
zinc plated, blue passivated

INFORMATION

Latches GN 117 are vibration proof and they have a pulling-in range of 10 mm. Locking is achieved by turning the knob clockwise.
Attention is drawn to its simple and hence cost saving installation.
Type GB (with threaded bolt) has been introduced to accept other types of handles besides the star knob.

TECHNICAL INFORMATION

- List of latch types (see page 1456)
- Plastic characteristics (see page A2)

CONSTRUCTION AND ASSEMBLY INSTRUCTIONS

By turning the latch clockwise the stepped and spring loaded cam latch moves up behind the door frame and pulls the door in.
The large pulling-in range of the cam (10 mm) allows these locks to be used successfully on doors with sealing strips. When selecting distance ‚Z` the thickness of the door seal might have to be taken into cosideration. The spring loaded cam (disc spring) prevents the door from opening under vibration.
A hole of 16 mm Ø is required in the door at a distance of 23 mm from door frame to hole centre. The bolt is inserted from the front. The distance piece, cam latch and disc springs follow on the shaft on the inside in that sequence.
The self-locking nut is fitted with a torque to allow free movement of the latch.

Weight type GB

Cam latches with knob

Steel or stainless steel cam

KNOB

Phenolic based (PF) Duroplast, black colour glossy finish.

STANDARD EXECUTIONS

- **VCK** (for doors with thickness S > 5 mm):
  - plain stud in zinc-plated steel;
  - helical latch cam in sintered and vaporized steel with hole for pinning;
  - spring dowel pin Ø 3x20 mm in black-oxide steel;
  - latch spring to compensate door thickness in zinc-plated steel;
  - opening to the right side (D) or left side (S).
- **VCK+G** (for doors with thickness S > 5 mm): as per VCK but with the interposition of guide bush and nut (except type with L = 24 mm), in nickel-plated brass and flat spring washer in zinc-plated steel.
  - opening to the right side (D) or left side (S).
- **VCK-SST** (for doors with thickness S > 5 mm):
  - plain stud in AISI 303 stainless steel;
  - helical latch cam in AISI 316 L sintered stainless steel with hole for pinning;
  - spring dowel pin Ø 3x20 mm in AISI 303 stainless steel;
  - latch spring to compensate door thickness in AISI 302 stainless steel;
  - opening to the right side (D) or left side (S).
- **VCK+G-SST** (for doors with thickness S ≤ 5 mm): as per VCK-SST but with the interposition of guide bush, nut and DIN 6798 flat spring washer in AISI 303 stainless steel.

The kit guide bush and nut is available as accessory sold separately (see table with codes and descriptions).

ASSEMBLY INSTRUCTIONS

1. Select the knob with stud length (l) according to the conditions reported in the here-under table.
2. Drill a cylindrical assembly hole in the door according to the conditions reported in the table.
3. Drill a hole in the stud for pinning at a distance "f" from the knob according to the conditions reported in the table.
4. Fit the stud in the hole on the door and assemble the other components.

VCK. latch-type knobs are supplied not assembled.

Cam latches with key

Steel or stainless steel cam

STANDARD EXECUTIONS

- **BOCK**:
  - shank in nickel-plated steel with triangular groove for key;
  - guide bush and locking nut (wrench 24) in nickel-plated brass;
  - DIN 6798 flat spring washer in zinc-plated steel;
  - helical latch cam in sintered and vaporized steel with hole for pinning;
  - spring dowel pin Ø 3x20 mm in black-oxide steel;
  - latch spring to compensate door thickness in zinc-plated steel;
  - Key in polyamide based (PA) technopolymer, black colour, matte finish.
  - opening to the right side (D) or left side (S).
- **BOCK-SST**:
  - shank with triangular groove for key, guide bush, locking nut (wrench 24),DIN 6798 flat spring washer in AISI 303 stainless steel;
  - helical latch cam in AISI 316 L sintered stainless steel with hole for pinning;
  - spring dowel pin Ø 3x20 mm in AISI 303 stainless steel;
  - latch spring to compensate door thickness in AISI 302 stainless steel;
  - Key in polyamide based (PA) technopolymer, black colour, matte finish.
  - opening to the right side (D) or left side (S).

ASSEMBLY INSTRUCTIONS

1. Select the latch with shank length (l) according to the following condition l ≥ S+b+15 mm (S = thickness of the door, b = thickness of the ledge).
2. Drill a hole in the door following the supplied template.
3. Drill a hole in the shank for pinning at "f" distance:
4. Fit the shank in the hole on the door and assemble the other components.

BOCK. latches are supplied not assembled.

GN 123

Sheet metal punches

for mounting latches

SPECIFICATION

Steel

Punch and die
hardened (56 - 58 HRC)

INFORMATION

These sheet metal punches GN 123 allow the operator to punch in a simple way fixing holes in sheet metal doors for latches with square V14 and V20.
Sheet metal punches GN 123 are ideally suited for punching holes into sheet metal up to 2 mm thickness.

ASSEMBLY INSTRUCTION

Set predrill hole d. We recommend using an adhesive tape with the centre of the punch hole and the datum lines showing.
Insert pull bolt with punch.
Attach the die, align along the datum lines and fix in place with the hexagon nut / set punch hole.

ON REQUEST

- Sheet metal punches GN 123.5 for Stainless Steel sheet.

Rotary clamping latches

SPECIFICATION

Types

- Type **RG**: Operation with knurled knob
- Type **VK7**: Operation with square spindle A/F7
- Type **VK8**: Operation with square spindle A/F8
- Type **DK**: Operation with triangular spindle (DK7)
- Type **SK6**: Operation with hexagon A/F6
- Type **VDE**: Operation with double bit

Housing
Zinc die casting
black plastic coated
black, RAL 9005, textured finish

other parts
Steel
zinc plated, blue passivated

Knurled knob (type RG)
Plastic (Polyamide PA)

- Handle black, matt
- Cover cap, light grey matt

INFORMATION

The outstanding feature of the rotary clamping latches GN 116.1 is their wide clamping range of 12 mm, with the 5 keys A1 to A5 covering a clamping range of 4 to 46 mm with broad overlap. This configuration allows large closing strokes within the individual key spacings, e.g. in connection with seals.
With the permissible tightening torque of 2 Nm for the clamping screw, the key generates a closing force of approx. 300 Nm at the key.

TECHNICAL INFORMATION

- List of latch types (see page 1456)
- Plastic characteristics (see page A2)

ACCESSORY

- Socket keys GN 119.2 (see page 1530)

CONSTRUCTION AND ASSEMBLY INSTRUCTIONS

By turning the latch clockwise, the key is first turned by 90° and so moved into the closing position.
When continuing to turn, the thread (M10) will move it in axial direction (max. 12 mm) and will finally clamp the door against the frame.
When opening by turning anti-clockwise, the key will move back and will release the door by a 90° turn.
The pressure spring generates the friction required for the 90° turn.
When mounting, the door is fitted with a bore hole as shown in the outline drawing.
The interlock is pushed through the bore hole from the front, the hexagon nut can be pushed over the key from the back. The mounting step is only possible if the key is located axially in the end position and approximately in the middle of the range of rotation.

CQT.AE-V0

Lever latches

with recessed key, technopolymer

MATERIAL
Stator, rotor, closing lever and nut (M22x1.5) in glass-fibre reinforced polyamide based (PA) technopolymer certified self-extinguish UL-94 V0, black colour, matte finish.

PACKING RING
SBR rubber.

INTERNAL TOOTHED WASHER
AISI 304 stainless steel.

SELF-TAPPING SCREW
AISI 304 stainless steel.

KEY
Polyamide based (PA) technopolymer.

ROTATION
90°.

IP PROTECTION
IP 65 protection class according to table EN 60529 (see page A23).

STANDARD EXECUTIONS
- **CQT/A**: mark for two-wings key.
- **CQT/T**: mark for triangular key.

TECHNICAL DATA
The "V0" certification in accordance with UL-94 V (Underwriters Laboratories) (see Technical Data on page A5) indicates that on a plastic test sample with specific shape and dimensions, in the vertical position, the flame is extinguished within 10 seconds, without generating incandescent drops.

SPECIAL EXECUTIONS ON REQUEST
- Cylindrical body of the closing lever in other dimensions.
- Latches and keys supplied separately.

Lever latches

with recessed key, zinc alloy

STATOR AND ROTOR
Nickel-plated zinc alloy.

NUT
For threaded stator M19X1 = brass.
For threaded stator M22x 1.5 = zinc-plated zinc alloy.

SHAPED CLOSING LEVER
Zinc-plated steel.
For threaded stator M19X1, thickness = 2.5 mm.
For threaded stator M22x 1.5, thickness = 3 mm.

SPRING WASHER
Zinc-plated steel.

PACKING RING
For threaded stator M19X1 = PVC.
For threaded stator M22x 1.5 = SBR rubber.

SCREW
M5x8 zinc-plated steel.

KEY
Polyamide based (PA) technopolymer.

ROTATION
90°.

IP PROTECTION
IP 65 protection class, according to table EN 60529 (see page A23).

STANDARD EXECUTIONS:
- **CQ/A**: two-wing groove for key.
- **CQ/T**: triangular groove for key.

SPECIAL EXECUTIONS AND ACCESSORIES
- Closing levers in other dimensions.
- Latches and keys supplied separately.
- Brass threaded extension for prolonged positioning of the lever (code 421137 C.PQ M5/58).

Lever latches with key

Quick-assembly, self-extinguishing technopolymer

MATERIAL
Glass-fibre reinforced polyamide-based (PA) technopolymer, black colour, certified self-extinguishing UL-94 V0.

PACKING RING
Silicone directly applied onto the back side of the stator head.

WASHER WITH ELASTIC FIXING WINGS AND SELF-TAPPING SCREWS
Stainless steel.

KEY
Polyamide based (PA) technopolymer.

ROTATION
90°.

IP PROTECTION
IP 65 protection class, according to table EN 60529 (see page A23).

STANDARD EXECUTIONS
- **CQT/A**: mark for two-wings key.
- **CQT/T**: mark for triangular key.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
130°C.

DISASSEMBLY TOOL (TO BE ORDERED SEPARATELY)
Code 421550 ATTREZZO CQT.FM. in AISI 304 stainless steel.

FEATURES
Quick assembly with steel plate thickness ranging from 1 to 2 mm latches.

TECHNICAL DATA
The "V0" certification in accordance with UL-94 V (Underwriters Laboratories) (see Technical Data on page A5) indicates that on a plastic test sample with specific shape and dimensions, in the vertical position, the flame is extinguished within 10 seconds, without generating incandescent drops.

SPECIAL EXECUTIONS ON REQUEST
- Closing levers in zinc-plated steel.
- Latches and keys supplied separately.

ASSEMBLY INSTRUCTIONS
The latch is inserted in the mounting hole of the door on the lever side (see picture) until the wings of the elastic washer snap in, ensuring complete fastening.
The latches are supplied with assembled lever for faster mounting.
Where needed, the latch can be disassembled from the inside of the door by means of a disassembling tool (to be ordered separately).

Lever latches with key

Quick-assembly, technopolymer

MATERIAL
Glass-fibre reinforced polyamide-based (PA) technopolymer, chrome-plated, glossy finish. Lever not chrome-plated.

PACKING RING
Silicone directly applied onto the back side of the stator head.

WASHER WITH ELASTIC FIXING WINGS AND SELF-TAPPING SCREWS
Stainless steel.

KEY
Polyamide based (PA) technopolymer.

ROTATION
90°.

IP PROTECTION
IP 65 protection class, according to table EN 60529 (see page A23).

STANDARD EXECUTIONS
- **CQT/A**: mark for two-wings key.
- **CQT/T**: mark for triangular key.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
80°C.

DISASSEMBLY TOOL (TO BE ORDERED SEPARATELY)
Code 421550 ATTREZZO CQT.FM. in AISI 304 stainless steel.

FEATURES
Quick assembly with steel plate thickness ranging from 1 to 2 mm latches.

TECHNICAL DATA
With its refined look, the latch CQT.FM-CR is particularly suitable for use in situations where frequent cleaning cycles are needed for hygienic reasons, also with the use of water sprays or steam.
The chrome-plated surface is resistant to wear, scrapes and shocks.
Laboratory tests carried out at ambient temperature (23°C) proved the resistance of the latch surface to: detergents, acetone, ethyl alcohol, formic acid, chlorine solutions.

SPECIAL EXECUTIONS ON REQUEST
- Closing levers in zinc-plated steel.
- Latches and keys supplied separately.

ASSEMBLY INSTRUCTIONS
The latch is inserted in the mounting hole of the door on the lever side (see picture) until the wings of the elastic washer snap in, ensuring complete fastening.
The latches are supplied with assembled lever for faster mounting.
Where needed, the latch can be disassembled from the inside of the door by means of a disassembling tool (to be ordered separately).

GN 115.1

Mini-Latches

Zinc die casting / Steel

SPECIFICATION

Types

- Type **DK**: Operation with triangular spindle (DK 6.5)
- Type **VK**: Operation with square spindle (VK 6)
- Type **SCH**: Operation with slot
- Type **SK**: Operation with wing knob
- Type **SCK**: Operation with wing knob, lockable

Lock housing
Zinc die casting, chrome plated

All other parts
Steel zinc plated, blue passivated

Wing knob (Type SK and SCK)
Zinc die casting
plastic coated black, textured finish

Key
Nickel silver with plastic hand piece

Protection class IP65
via the housing gasket and the O-ring

INFORMATION

Mini-Latches GN 115.1 have smaller dimensions than latches GN 115. They lock by a turning operation limited to 90° which moves the locking behind the door frame. The bevels of the locking ease the closing of the door.
Latches with different cranks cover a latch distance A from 7.5 to 19.5 mm.
The lockable latch (Type SCK) is supplied with two keys. The key may be pulled off in both end positions.
In their standard design, the latches have the same lock / the same key.
Mini-Latches GN 115.1 are supplied with loosely enclosed latch.

TECHNICAL INFORMATION

- List of latch types (see page 1456)
- IP Protection classes (see page A23)

ACCESSORY

- Socket keys GN 119.2 (see page 1530)
- Protective caps GN 120 (see page 1486)

CONSTRUCTION AND ASSEMBLY INSTRUCTIONS

For installation, set a bore diameter in the door as shown in the outline drawing.
Once assembled, the latch is pushed through the bore diameter from the front. The hexagon nut can then be pushed over the latch from the back and bolted in place.
The **installation bore diameter** in the door leaf is usually generated by punching or laser machining in series production.
For small series and steel sheets below 2 mm thickness, the sheet metal punches GN 123 (see page 1493) are the tool of choice.
The installation bore diameter can also be set by drilling / milling as shown in the outline drawings.

Glass-fibre reinforced polyamide based (PA) technopolymer, grey-black colour, matte finish.

LOCK
- stator and rotor in Zamac;
- lock with stainless steel front plate, movement of the lever at 90°;
- locking nut in brass;
- spring washer in zinc-plated steel;
- zinc-plated steel positioning washer, thickness 1.2 mm to be welded to the sheet of the door in case of thin thickness;
- two keys in nickel-plated brass, removable in two positions (locked or unlocked position);

STANDARD EXECUTIONS
Lock with 400 different combinations. Each lock has a key with different combination.
- **ELCK-1-D**: with zinc-plated steel flat closing lever, opening on the right side.
- **ELCK-1-S**: with zinc-plated steel flat closing lever, opening on the left side.
- **ELCK-1-SS**: with zinc-plated steel flat closing lever (1), without lock. Therefore, the control lever can be used for opening both on the right or on the left side.
- **ELCK-2**: available in all the above mentioned executions but with folded closing lever.

ACCESSORIES ON REQUEST
Threaded extension for the positioning of the closing lever with l=10 mm (ELCK with flat lever) or l=18 mm (ELCK with folded lever).

SPECIAL EXECUTIONS ON REQUEST
- ELCK-U: lock with one combination: all locks have the same combination and open with the same key.
- ELCK-M: lock with 160 different combinations and master-key: each lock has a different combination and relative key. Two master-keys, which open all of them, are supplied for every purchase order.

Even the special executions are available with opening on the right or on the left side, with flat or folded closing lever.

Lever latches

with lock, technopolymer knob

KNOB

High-resilience polypropylene based (PP) technopolymer.

STANDARD EXECUTIONS

- **VC.308**: with flat closing lever in zinc-plated steel;
  - stator and rotor in Zamac;
  - lock with stainless steel front plate, movement of the knob at 90°;
  - locking nut in brass;
  - spring washer in zinc-plated steel;
  - positioning washer in zinc-plated steel, thickness 1.2 mm to be welded to the metal sheet of the door for thin thickness;
  - two keys in nickel-plated brass, removable in two positions (locked or unlocked position);
  - opening to the right side (D) or to the left side (S);
  - lock with 400 different combinations. Each lock has a key with different combination;
- **VC.308-U**: lock with one combination. All locks have the same combination and can be opended with the same key;
- **VC.308-M**: lock with 160 different combinations and master-key. Each lock has a different combination and a relevant key. Two master-keys, which open all of them, are supplied for every purchase order;
- **VC.308-SS**: without lock. The knob can be used for opening both to the right or to left side;
- **VC.309**: available in all the above mentioned executions but with folded closing lever.

ACCESSORIES ON REQUEST

Threaded extension to position the closing lever with l=10 mm (VC.308) or l=18 mm (VC.309).

CS-RPR.

Lever latches with key

Reprogrammable lock, steel

LOCK
With opposing blades and double profile key with internal track, (to be ordered separately, see below keys kit). 9.791 different lock combinations.

STATOR AND ROTOR
Chrome-plated zinc alloy with drill-proof hardened steel plate and stainless steel front plate.

NUT
Brass M19x1

TOOTHED WASHERS
For zinc-plated steel stator, for steel screw.

CLOSING LEVER
Zinc-plated steel, thickness 2.5 mm.

NUT
Brass.

SCREW
Zinc-plated steel (only for executions CS-RPR.32-30 and CS-RPR.36-35).

ROTATION
180°, with key removable in two positions.

KEYS KIT
The KCR keys kit (to be ordered separately) consists of a brass programming key and some nickel silver keys for normal use.
- **KCR-05**: 1 programming key and 5 keys for normal use.
- **KCR-10**: 1 programming key and 10 keys for normal use.
- **KCR-01**: 25 keys for normal use.

SPECIAL EXECUTIONS AND ACCESSORIES
- Closing levers in other dimensions.
- Other keys kits with different programming.

FEATURES AND APPLICATIONS
The CS-RPR are supplied non-programmed with the rotor positioned in line with the index marked on the stator front surface.
- First programming: insert the programming brass key and turn the lock clockwise by 45° (Fig.1). The lock is now programmed. Insert the normal use key in nickel silver to lock or unlock the latch (Fig.2).
- Reprogramming of the lock: insert the brass programming key used at first and turn the lock anticlockwise by 45° until the rotor is in the neutral position (Fig.3). Remove the key, insert now a new programming key (new kit) and turn it clockwise by 45° (Fig.1).

Now the lock has been reprogrammed with a new combination and the nickel silver normal use keys, included in the kit of the new programming key, must be used to lock or unlock the latch (Fig.2).

Lever latches with key

Lock, zinc alloy

STATOR
Brass-plated zinc alloy.

ROTOR
Chrome-plated zinc alloy.

FRONT PLATE
Stainless steel.

NUT
M19x1 in brass.

FLAT SPRING WASHER
Zinc-plated steel (only for l1=13 and 16 mm),

INTERNAL TOOTHED WASHER
Zinc-plated steel.

CLOSING LEVER
Zinc-plated steel, thickness 2.5 mm.
Assembly by means of hexagon nut M6x0.75 for l1=13, 16 and 18 mm, assembly with screw M5x5 for l1=20 mm or with screw M5x8 for l1=25 and 30 mm.

TWO KEYS
Nickel-plated brass, removable in two positions at 180°.

ROTATION
180°.

STANDARD EXECUTIONS
- **CS.**: lock with 400 different combinations. Each lock has a couple of keys with different combination.
- **CSU.**: lock with one combination. All locks have a key with the same combination.

SPECIAL EXECUTIONS AND ACCESSORIES
- Closing levers in other dimensions.
- Brass threaded extension for prolonged positioning of the lever, only for stator lengths l1 = 20, 25 and 30 mm (code 421137 C.PQ M5/58).

Lever latches with T-Handle

Operation with key, technopolymer

HANDLE AND STATOR
Glass-fibre reinforced polyamide based (PA) technopolymer.

ROTOR
Chrome-plated zinc alloy.

FRONT PLATE
Stainless steel.

NUT
M22x1.5 technopolymer.

FLAT CLOSING LEVER
Zinc-plated steel, thickness 3 mm.

PACKING RING
NBR rubber.

SELF-TAPPING SCREW
Zinc-plated steel.

TWO KEYS
Nickel-plated brass, removable in two positions at 180°.

ROTATION
90° clockwise (right).

IP PROTECTION
IP 65 protection class, according to table EN 60529 (see page A23).

STANDARD EXECUTIONS
- **CSMT.**: lock with 400 different combinations. Each lock has a couple of keys with different combination.
- **CSMTU.**: lock with one combination. All locks have the same combination which can be opened with the same key.

SPECIAL EXECUTIONS ON REQUEST
Closing levers in other dimensions.

Lever latches with T-Handle

Operation with key, anti-rotation device, technopolymer

HANDLE AND STATOR
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, RAL 3020 red colour mobile part.

ROTOR
Zinc alloy with superficial chromate treatment.

SPRINGS
Stainless steel.

FRONT PLATE
Stainless steel.

NUT
M22x1.5 in technopolymer.

FLAT CLOSING LEVER
Zinc-plated steel, thickness 3 mm.

PACKING RING
NBR rubber.

SELF-TAPPING SCREW
Zinc-plated steel.

TWO KEYS
Nickel-plated brass, removable in two positions at 180°.

ROTATION
90° clockwise (right).

IP PROTECTION
IP 65 protection class, according to table EN 60529 (see page A23).

STANDARD EXECUTIONS
- **CSMT-A**: lock with 400 different combinations. Each lock has a couple of keys with different combination.
- **CSMTU-A**: lock with one combination. All locks have the same combination which can be opened with the same key.

FEATURES AND APPLICATIONS
Latch-type handles with anti-rotation device CSMT-A are particularly suitable for applications on cabinets or doors subject to strong vibrations. The anti-rotation device prevents the door from opening accidentally due to vibrations when the latch is not locked.
After opening the lock by means of the key (fig. 1) the handle can be turned by pulling the red body towards the operator (fig.2). By turning the handle in the lock position (fig.3), the anti-rotation mechanism is engaged automatically (fig.4).

SPECIAL EXECUTIONS ON REQUEST
Closing levers in other dimensions.

Latches for cabinets

with handle for rod controls, technopolymer and zinc alloy

HANDLE
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

BASE
Nickel-plated zamac.

PACKING RING
Silicon directly applied under the handle base.

HANDLE SHANK
Chrome-plated zinc alloy with NBR synthetic rubber O-ring.

ROD CONTROL
Chrome-plated zinc alloy.

STANDARD EXECUTIONS
European style stator.
- **CLC-EU**.: lock with different combinations. Each lock has two nickel-plated brass keys, with different combination, removable at 180°.
- **CLCU-EU**: lock with one combination. All locks have a couple of keys in nickel-plated brass and the same combination which can be opened with the same key removable at 180°.
- **CLCA-EU**: lock with two-wing groove and technopolymer key with zamac insert supplied.

Index to add to the above mentioned executions:
- **IP**: executions with protection plug and packing ring with IP 65 protection class, according to table EN 60529 (see page A23), with two zinc-plated setting screws, supplied.

ACCESSORIES ON REQUEST
- One pair of black technopolymer rod guides.
- One pair of flat galvanised steel rods.
- One pair of zinc-alloy connecting bars.

- **EU-IP**: executions with European style stator and protection plug and packing ring with IP 65 protection class, according to table EN 60529 (see page A23) , with two zinc-plated setting screws, supplied.

ACCESSORIES ON REQUEST
CLT. latches with handle for rod controls are generally used with rod control CAR. (see page 1518) to be ordered separately (see Assembly drawing attached).

Other accessories available on request:
- black technopolymer rod guides: one rod guide every 500 mm of rod control (code 421133 C.GAT);
- 2 flat galvanised steel rod guides, section 14x3 mm, length 1.000 mm and black technopolymer edge rolls for frame 20 mm thick (code 421135 C.AT 1000-20).
- 2 flat galvanised steel rod guides, section 14x3 mm, length 1.000 mm and black technopolymer edge rolls for frame 25 mm thick (code 421136 C.AT 1000-25).
- Latch-type handles with lock with different groove for key.

Locking bolt

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer with security anti-intrusion-profiled slot, black colour, matte finish.

LOCKING BAR
AISI 304 stainless steel with technopolymer push button. Side end in red colour.

STANDARD EXECUTIONS
- **CKE.40 CH**: pass-through holes for M5 cylindrical-head screws.
- **CKE.40 B**: brass bosses, threaded blind holes.

SECURITY KEY (TO BE ORDERED SEPARATELY)
- **CSN (code 6951)**: acetal resin based (POM) technopolymer fold-away key, red colour, anti-intrusion-profiled stainless steel insert.
- **CSF (code 6952)**: polyamide based (PA) technopolymer ball key, red colour, anti-intrusion-profiled stainless steel insert.
- **CSL (code 6953)**: acetal resin based (POM) technopolymer size increased fold-away key, red colour, stainless steel insert.

FUNCTIONING OF THE SAFETY DEVICE
Doors with CKE. locking bolt assembled can be opened only by authorised people provided with the proper anti-intrusion-profiled key.
1. Locking: press the locking button until the red side end of it disappears completely into the body and the device snaps. The key must not be inserted during locking operations.
2. Opening: insert the key (without turning it) and push to make the internal device snap.

Ball-shaped door lock

Technopolymer

CLAMP
Acetal resin based (POM) technopolymer.

BALL
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

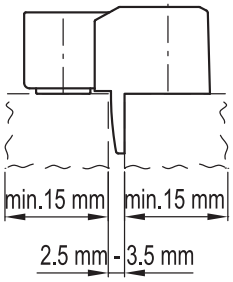
MOUNTING
Self-tapping screw Ø 4.8 mm. UNI 7981 B or M5 cylindrical head screw with hexagon socket DIN 912.

FEATURES AND APPLICATIONS
BPS ball-shaped door lock (ELESA patent) consists of a clamp to be fixed to a frame and a ball to be fixed to a door.
The clamp, in which the ball fixed to the closing door is inserted, is a mechanical stop device also to the door movement, thanks to its shape.
The screws, that fix the clamp and the ball respectively to the frame and to the door, are identical. Thus, making the assembly easier.
Under specific tests, the clamp showed constant performances for more than 20.000 cycles.
The ball-shaped door lock has been conceived for use with both shutter doors and sliding doors.
The minimum thickness for the profile suitable for use is 15 mm, while the distance between door and frame must be within 2.5 mm and 3.5 mm (fig.1).

ACCESSORIES ON REQUEST
BPS.30-SP: acetal based (POM) technopolymer spacers kit 5, 10, 15 mm (sold separately), black colour in order to compensate possible differences in width between frame and door.

ELESA Original design

Fig.1



Examples of BPS.30-SP spacers assembly

Snap door lock

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black or grey colour RAL 7040 (C33), matte finish.

SPRING
Stainless steel.

STANDARD EXECUTIONS
- **BMS**: snap lock and unlock.
  - It consists of a return spring and a fixing plate.
  - It is used for pull opening of doors by means of a handle.
- **BMS.L**: snap lock and lever for manual release.
  - It consists of a return spring for manual operation and a fixing plate.
  - It is used for pull opening of doors through the use of the release lever which also represents the handle grip.
  - When the lever is locked, the maximum load at breakage of the door lock is = 2500 N.

FEATURES AND APPLICATIONS
The snap door lock allows the closure of the swing doors in a quick and easy way. For the installation of a door lock, use M4 TCEI screws (not included in the supply).

SPECIAL EXECUTION ON REQUEST
Door lock in white colour similar to RAL 9002.

***** Values referring to the installation with hole centre distance of 34 mm (Fig. 1)

BMST

Snap door lock

for T-slot profiles, technopolymer

MATERIAL
Bodies of the snap door lock made out of glass-fibre reinforced polyamide based (PA) technopolymer.
Polyester based (PBT) technopolymer screw-covers.
Black or grey RAL 7040 (C33) colour, matte finish.

SPRING
Stainless steel.

CLAMPING PLATE
Black-oxide steel.

STANDARD EXECUTIONS
- **BMST**: locking and unlocking spring device for closing doors, pull opening by means of handle or knob (Fig.1).
- **BMST.L**: locking and unlocking spring device for closing doors, pull opening by means of lifting lever (Fig.2).

MOUNTING
For the perfect functioning of the door lock, it is recommended to keep a distance of 1 mm between the two bodies.
The force values in the table are referred to this distance.
For assembly use the clamping plates (included in the supply) and TCEI M6 screws (Fig.3).
For removing the screw-covers use a screwdriver (Fig.4).

FEATURES AND APPLICATIONS
The snap door lock allows the quick closure of swing doors.
Assembly on T-slot standard profiles with dimensions between 30 and 40 mm.
Load at breakage of the door lock in the closed position = 4500 N.

SPECIAL EXECUTION ON REQUEST
Door lock in white colour similar to RAL 9002.

Door lock handles

with or without built-in lock, technopolymer

ERGOSTYLE®

HANDLE
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish. Acetal resin based (POM) technopolymer retention wings.

STATOR AND ROTOR
Nickel-plated zinc alloy.

CLOSING LEVER
Zinc-plated steel, 2 mm thickness.

TWO KEYS
Nickel-plated brass.

STANDARD EXECUTIONS

ESC.90	-	BM ①	-	K ②	-	90 ③	-	F ④

① **BM**: back mounting.
FM: front mounting.

② **K**: with lock.
SS: without lock.

Only for K execution

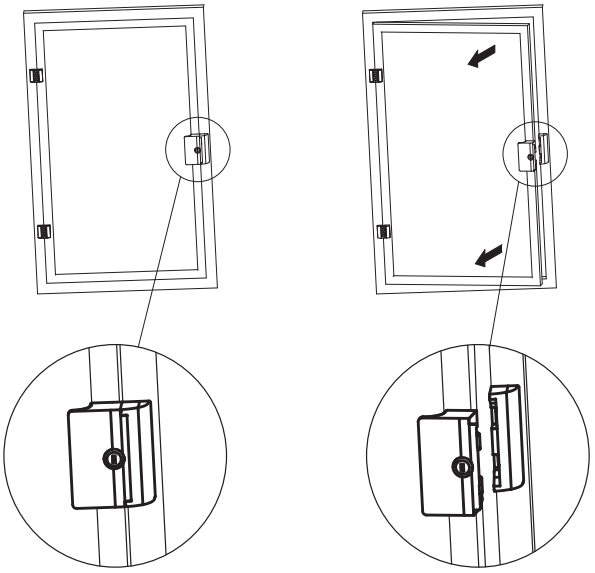
③ **90**: lock with key (100 combinations) removable in the closing position, rotation by 90°.
180: lock with key (200 combinations) removable in two positions at 180°, rotation by 180°.

④ **F**: different combination.
U: same combination (all locks can be opened with the same key).

Order example with lock:
225023 ESC.90-BM-K-90-F
Order example without lock:
225021 ESC.90-BM-SS

FEATURES AND APPLICATIONS
- ESC door lock handle (ELESA patent) keeps the door locked in the closed position. Because of its location outside the door, its installation is very simple.
- The handle dimensions are such as to allow the assembly on profiles with a minimum size of 25 mm and a maximum of 40 mm.
- The handle is able to compensate for any misalignment of the door bringing it back to the correct position while closing by means of the built-in guides.
- The handle is tamperproof from the outside thanks to the rear fastening (ESC.90-BM) or front fastening (ESC.90-FM) with caps not removable when the handle is closed and preventing access to the screws.
- Under specific tests the handle has always maintained unchanged performance for over 40000 cycles.

Application example



ASSEMBLY INSTRUCTIONS

To ensure a correct opening release strength (45 N as long as the handle is assembled in best conditions), we recommend to position the two elements of the handle as close as possible (Fig. 1) during assembly.

Rear mounting by means of M6 hexagonal-head screws DIN 933 or M6 hexagonal nuts DIN 439B: place the screw as shown in Fig. 2. For ease of assembly with the nut, we recommend initially to fasten the nut as shown in the drawing.

Front mounting by means of M6 cylindrical-head screws: place the doorframe and the door by applying the relevant caps that prevent access to the screws (Fig. 3) (tamperproof).

Suggested tightening torque: 5 Nm.

Only when the door is open, it is possible to remove the caps with a screwdriver on both the door (Fig. 4) and the doorframe (Fig. 5).

Latches with push handle

Zinc alloy

HANDLE
Die-cast zinc alloy, provided with a hole for the insertion of a padlock with the hook of max diameter 9 mm.

FRONT BODY
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

SPINDLE AND PROTECTION CAP
Die-cast zinc alloy.

CLAMPING LEVER
Cylindrical element made out of die-cast zinc alloy, adjustable position by means of a hexagon socket grub screw, glass-fibre reinforced polyamide based (PA) technopolymer coating, black colour.

PACKING RING
Silicone strip applied to the base of the handle.

LOCK
With dustcover made out of acetal resin based (POM) technopolymer, red colour.
Two nickel-plated brass keys, removable in two positions at 90°.

IP PROTECTION
IP 65 protection class,IP65, see Table EN 60529 (see page A23).

STANDARD EXECUTIONS
Assembly by means of 4 zinc-plated steel screws co-moulded into the base and 4 zinc-plated steel nuts with thread lock included in the supply.
- **CSMH**: lock with 400 different combinations.
- **CSMH-U**: lock with one combination (all locks have a key with the same combination).

Index for handle colour:
- **BK**: black coated.
- **GR**: grey coated.

FEATURES AND APPLICATIONS
Close the door and move the lever to the closed position by rotating the handle by 90°. The overturning of the handle in its seat moves the spindle axially with the lever in the direction of the swing-door, until reaching the locking position.
The lock locks the handle in the folded position.
CSMH latches with compression handle guarantee a clamping range from 13 to 75 mm.

ACCESSORIES ON REQUEST
Microswitch for remote signaling of the handle position.

SPECIAL EXECUTION ON REQUEST
Executions with spindle of length 45 mm for range of latches from 13 to 43 mm.

Latches with gripping tray

Operation with key, lockable / not lockable

SPECIFICATION

Lockable version:

Types

- Type **SC**: Operation with key (same lock)
- Type **SU**: Operation with key (different lock)

Identification no.

- No. **1**: Operation, in drawn position, at the top left
- No. **2**: Operation, in drawn position, at the top right

Front frame, zinc die casting, plastic coated
black, RAL 9005, textured finish **SW**
silver, RAL 9006, textured finish **SR**

Tray, plastic

- black grey (for SW)
- light grey (for SR)

Key
Nickel silver with plastic hand piece

other parts
Steel zinc plated, blue passivated

Not lockable version:

Types

- Type **DK**: Operation with triangular spindle (DK7)
- Type **VK7**: Operation with square spindle A/F7
- Type **VK8**: Operaton with square spindle A/F8
- Type **SCH**: Operation with slot
- Type **VDE**: Operation with double bit

Identification no.

- No. **1**: Operation, in drawn position, at the top left
- No. **2**: Operation, in drawn position, at the top right

Front frame, zinc die casting, plastic coated
black, RAL 9005, textured finish **SW**
silver, RAL 9006, textured finish **SR**

Tray, plastic

- black grey (for SW)
- light grey (for SR)

Operating part
Zinc die casting

- plastic coated, black (for SW)
- chrome-plated (for SR)

other parts
Steel zinc plated, blue passivated

INFORMATION

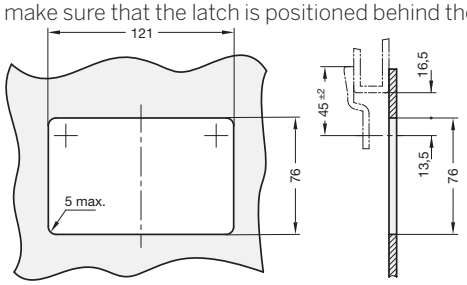
Latches with gripping tray GN 115.10 are used in applications which require a moulded recess in addition to the latching mechanism, e.g. if operating elements are not allowed to protrude for reasons of space.
A rotary movement limited to 90° moves the latch behind the frame, with the run-up bevels at the latch making it easier to close the door.
Latches with different cranks cover a latch distance A from 4 to 50 mm.
The types with a different lock are available in more than 200 variants, whose key is marked by numbers.
The scope of delivery includes a separately enclosed latch as well as two keys removable in both end positions.

ACCESSORY

- Socket keys GN 119.2 (see page 1530)

CONSTRUCTION AND ASSEMBLY INSTRUCTIONS

Before assembly, a nick must be made in the door as shown in the drawing.
Depending on position of the latch, the 16.5 mm edge spacing between frame and nick must be ensured sideways and / or top and bottom ot make sure that the latch is positioned behind the frame.



For the assembly, insert the front frame together with the pre-assembled latch from the front through the nick of the door by tilting. Place the plastic tray from the back onto the bore pegs of the front frame.
The M4x12 fillister-head screws included are then screwed in from the rear and tightened to fix and wedge the whole unit in place. The minimum screw-in depth of the screw is guaranteed with a maximum door wall thickness of 7 mm.

plastic coated
black, textured finish **SW**

INFORMATION

Socket keys GN 119.2 are suitable for the following latches:

- Mini-Latches GN 115.1 (see page 1504)
- Stainless Steel-Mini-Latches GN 115.6 (see page 1505)
- Latches, lockable GN 115 (see page 1462)
- Latches, not lockable GN 115 (see page 1465)
- Latches with key GN 115 (see page 1468)
- Stainless Steel-Hygienic latches GN 115 (see page 1471)
- Latches with cabinet "U" handle GN 115.7 (see page 1472)
- Hook-type latches GN 115.8 (see page 1474)
- Latches with gripping tray GN 115.10 (see page 1527)
- Rotary clamping latches GN 116.1 (see page 1494)
- Latches GN 119 (see page 1482)
- Latches with cabinet "U" handle GN 119.3 (see page 1484)
- Rotary clamping latches GN 516 (see page 1542)
- Rotary clamping latches GN 516.1 (see page 1544)
- Stainless Steel-Rotary clamping latches GN 516.5 (see page 1546)

Flush pull handles with lever latch

Snap-in assembly, technopolymer

ELESA Original design

HANDLE AND STATOR

Glass-fibre reinforced polyamide based (PA) technopolymer, grey-black colour, matte finish.

TWO KEYS

Nickel-plated brass or polyamide based (PA) technopolymer.

STANDARD EXECUTIONS

PR.92-CH	-	D ①	-	K ②	-	F ③

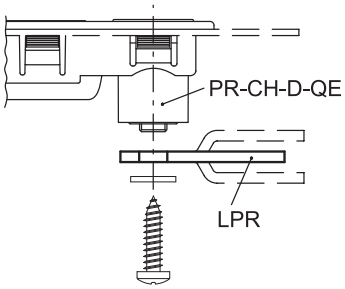
① **D**: lock placed on the right.
S: lock placed on the left.

② **K**: lock with key removable in two positions, rotation by 90°; brass-plated zinc alloy rotor.
QE: electrical panel lock type; glass-fibre reinforced polyamide-based (PA) technopolymer rotor; AISI 304 stainless steel screw and washer.

③ *Only for K execution*
F: different combination (400 combinations).
U: same combination (all locks can be opened with the same key).
M: different combination with master-key (160 combinations). Two master-keys, which open all of them, are supplied for every purchase order.

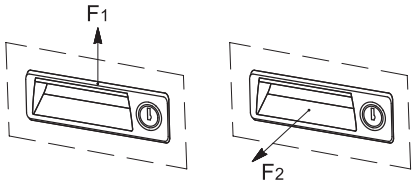
Only for QE execution
T: lock with triangular groove.
Q: lock with square groove.
A: lock with two-wing groove.

Order example for K execution:
51911 PR.92-CH-D-K-F
Order example for QE execution:
51921 PR.92-CH-D-QE-T

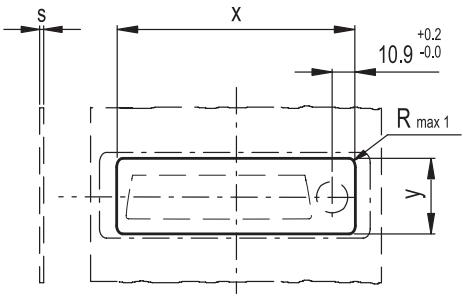


TECHNICAL DATA

The lifting (F1) and pull out (F2) resistance values reported in the table are the result of tests carried out in the laboratory with handles assembled on metal sheet panels with thickness = 1.5 mm.



Drilling template



s	x	y
0.7÷1	$110^{+0.3}$	$30.5^{+0.1}$
1÷1.5	$110^{+0.3}$	$30.7^{+0.1}$
1.5÷2	$110^{+0.3}$	$31.7^{+0.1}$
2÷2.2	$110^{+0.3}$	$31.7^{+0.1}$

ACCESSORIES ON REQUEST (TO BE ORDERED SEPARATELY)

Closing lever LPR. (see page 1531).

ASSEMBLY INSTRUCTIONS

1. Drill the handle housing according to the template dimensions reported in the table.
2. Remove all drilling burrs before fitting the handle.
3. Fit the upper part of the handle into the housing (Fig. 1).
4. Press onto the lower part until the handle is completely snapped in (Fig. 2).

Handles with latch

Technopolymer

ERGOSTYLE®

HANDLE
Glass-fibre reinforced polyamide based (PA) technopolymer, grey-black colour, matte finish.

LOCK
- Glass-fibre reinforced polyamide-based (PA) technopolymer rotor, grey-black colour, matte finish. NBR rubber O-Ring.
- Brass stator M22x1,5.
- Zinc alloy locking nut M22x1,5.
- Zinc alloy shaped closing lever, thickness = 4 mm.
- Zinc-plated steel toothed washer.
- Zinc-plated steel self-tapping screw.

KEY
Polyamide based (PA) technopolymer, grey-black colour, matte finish.

STANDARD EXECUTION
Brass boss, threaded blind hole.
- **EBP-CH-T**: triangular groove for key.
- **EBP-CH-A**: two-wing groove for key.

ROTATION
90°.

TECHNICAL DATA
Tensile stress and impact strength: the values F1, F2, L1 and L2 indicated in the table were obtained during breaking tests carried out with the appropriate dynamometric equipment under the test conditions shown in the figure with ambient temperature.
The value F3 shown in the table represents the load under traction in the closed condition of the handle.

ASSEMBLY INSTRUCTIONS
1. Drill the holes in the door following the supplied template.
2. Fit the handle.
3. Screw the nut on the stator and the screw in the tapped boss to secure the handle to the door.
4. Fit the rotor into the handle seat.
5. Fix the lever to the end of the rotor by means of a washer and a threaded screw.

Handle with safety locking device

Technopolymer

ERGOSTYLE®

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer with security anti-intrusion-profiled slot, grey-black colour, matte finish.

LOCKING PIN
AISI 304 stainless steel pin with technopolymer push button, cylindrical walls in red colour.

KEY RETENTION DEVICE
Ball and AISI 316 stainless steel spring.

CAPS
Technopolymer in Ergostyle colours, glossy finish; supplied with the handle, press-fit assembly, removable by a screwdriver.
Available also as accessories sold separately (see table ECA.).

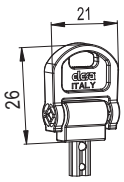
Code	Description	Caps for
29831-*	ECA.B1-*	EBR.150

* Complete with colour index (C1, ..., C6).

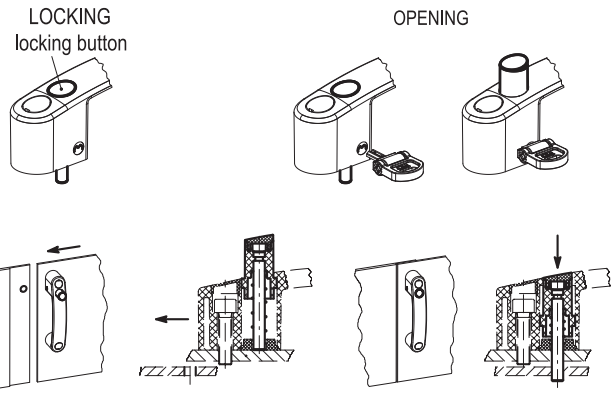
STANDARD EXECUTION
Pass-through holes for cylindrical-head screws with hexagon socket.

ANTI-INTRUSION PROFILED SECURITY KEY (TO BE ORDERED SEPARATELY)
CSN (code 6951): acetal resin based (POM) technopolymer fold-away key, red colour, stainless steel insert.

CSN



FUNCTIONING OF THE LOCKING DEVICE
Doors with EBR-CH handle can be opened only by authorised people, by inserting the anti-intrusion profiled key into its proper slot.
Locking: press the locking button until the red side end of it disappears completely into the body and the device snaps. The key must not be inserted during locking operations.
Opening: insert the key (without turning it) and push to make the internal device snap.
A ball spring retaining system ensures the retention of the key if the key remains inserted in its slot during the usual operations of door opening and closing.



TECHNICAL DATA
Tensile stress and impact strength: the values F1, F2, L1 and L2 indicated in the table were obtained during breaking tests carried out with the appropriate dynamometric equipment under the test conditions shown in the figure with ambient temperature.

GN 315

Snap locks

Locking distance A1 / A2 adjustable

SPECIFICATION

Housing
Zinc die casting

- corrosion-resistant, ZNDG Pass. nano®-coating
- anthracite coloured

Setting sleeve
Steel
plastic coated black,
matt textured finish

Operating button / slide
Plastic (Polyamide PA)
black, matt finish

Push button
Plastic (Polyamide PA)
light grey

Hexagon nut
Steel zinc plated, blue passivated

INFORMATION

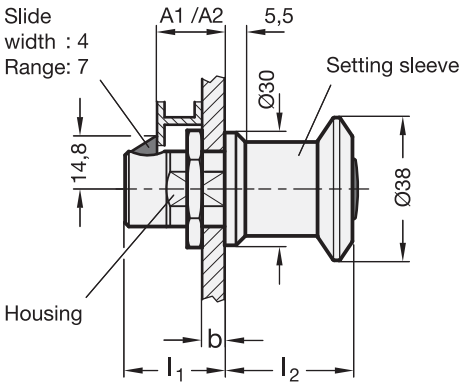
Snap locks GN 315 are characterised by a radial, spring-loaded slide causing the locking action.
When closing the door, the locking action sets in automatically. The bevelled slide is first pushed back via an appropriately arranged lug and then moved into the locking position by the pressure spring.
The door is unlocked via the push button.
To operate the door, these snap locks are fitted with an operating button.

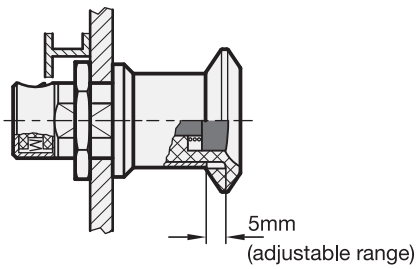
TECHNICAL INFORMATION

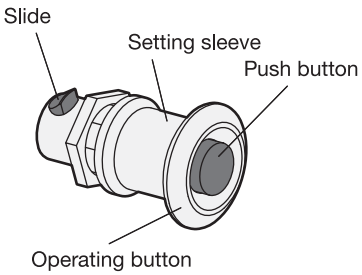
- Plastic characteristics (see page A2)

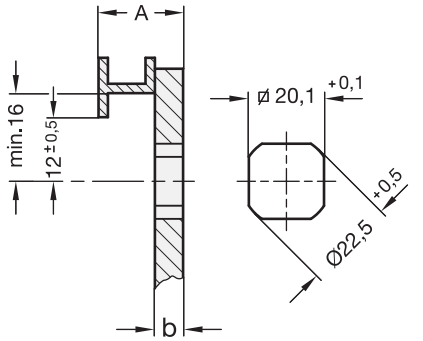
CONSTRUCTION AND ASSEMBLY INSTRUCTIONS

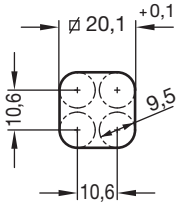
These snap locks can be used to latch a door, but not to clamp it.
This is why it is important to position the locking distance A (door + frame width) with great accuracy and precision.
For snap locks GN 315, the locking distance can be set continuously via the setting sleeve adjustable via a precision thread. This makes installation a great deal easier.
For installation, set a bore diameter in the door as shown in the outline drawing.
The snap lock is pushed through the bore diameter from the front and mounted from the back with a hexagon nut.
The **installation bore diameter** in the door leaf is usually generated by punching or laser machining in series production.
For small series and steel sheets below 2 mm thickness, the sheet metal punches GN 123 (see page 1493) are the tool of choice.
The installation bore diameter can also be set by drilling / milling as shown in the outline drawings.

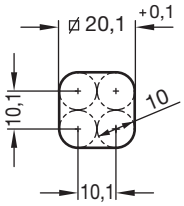












GN 315

Description	Locking distance min.	Locking distance max.	b max.	l1	l2	⚖
GN 315-A1	18	23	10.5 | 15.5	26.5 | 31.5	34 | 29	100

GN 315.1

Snap locks

two locking distances A

SPECIFICATION

Housing
Zinc die casting

- corrosion-resistant, ZNDG Pass. nano®-coating
- anthracite coloured

Locating ring
additionally plastic coated
black, matt textured finish

Slide
Plastic (Polyamide PA)
black

Push button
Plastic (Polyamide PA)
light grey

Hexagon nut
Steel zinc plated, blue passivated

INFORMATION

Snap locks GN 315.1 are characterised by a radial, spring-loaded slide causing the locking action.
When closing the door, the locking action sets in automatically. The bevelled slide is first pushed back via an appropriately arranged lug and then moved into the locking position by the pressure spring.
The door is unlocked via the push button.
If no operating element is needed to operate the door or if such element is arranged separately, snap locks GN 315.1 are used.

TECHNICAL INFORMATION

- Plastic characteristics (see page A2)

ACCESSORY

- Opening handles GN 120.1 (see page 1487)

CONSTRUCTION AND ASSEMBLY INSTRUCTIONS

These snap locks can be used to latch a door, but not to clamp it.
This is why it is important to position the locking distance A (door + frame width) with great accuracy and precision.
For installation, set a bore diameter in the door as shown in the outline drawing.
The snap lock is pushed through the bore diameter from the front and mounted from the back with a hexagon nut.
The **installation bore diameter** in the door leaf is usually generated by punching or laser machining in series production.
For small series and steel sheets below 2 mm thickness, the sheet metal punches GN 123 (see page 1493) are the tool of choice.
The installation bore diameter can also be set by drilling / milling as shown in the outline drawings.

GN 315.1-25	25	17	33.5	66

Stop locks

with 4 indexing positions (4 x 90°)

SPECIFICATION

Types

- Type **A**: with flange for surface mounting
- Type **B**: with female thread
- Type **C**: with male thread

Latch
Zinc die casting, plastic coated
black, RAL 9005, textured finish **SW**
red, RAL 3000, textured finish **RS**

Indexing mechanism
Type A
Zinc die casting / Plastic

Type B / Type C
Steel / Plastic
Steel parts zinc plated, blue passivated

Fastening flange, zinc die casting
plastic coated, black, matt

INFORMATION

Stop locks GN 702 are particularly suitable for light-weight applications not exposed to dynamic loads, e.g. for keeping drawers closed.
To mount stop locks of Type C, bore holes as shown in the diagram below must be set in the attachment surface.
These mounting holes are usually made by punching or with laser.
For small series and steel sheets below 2 mm thickness, the sheet metal punches GN 123 (see page 1493) are the tool of choice.
The mounting bore holes can also be made by drilling / milling.

Countersunk screw DIN 7991
Stainless Steel (A2)

INFORMATION

Stop locks GN 720 may be used as stops and feature a high degree of stability.
The inside ball-spring latching mechanism has 4 latching positions at a distance of 90° each. Thanks to the bolt attachment using the countersunk screw, the latching position is freely selectable.
The bar is solid and may be machined, if required.
The countersunk screw is enclosed as part of the set.

all handles (Type RG / KG / HG)

- Plastic (Polyamide PA) black, matt
- Cover cap light grey, matt

Protection class: IP 65

INFORMATION

The rotary clamping latches GN 516 have a closing mechanism which transfers the rotary movement of the operating element (key) into a 90° turn and then into a 6 mm linear stroke.
This mechanism is designed for common applications such as making a tight and vibration-proof interlock in the end position (retaining position) in connection with an elastic element (door / casing seal).
22 latches with different cranks will cover latch distances (retaining zones) of between 17 and 63 mm. If the measured retaining position lies between two latch distances A, the next smaller value must be selected.
The rotary clamping latches GN 516 are supplied with loosely enclosed latch.

TECHNICAL AND ASSEMBLY INSTRUCTIONS

1. Latch in starting position.
2. The first 90° turn of the actuator / key moves the latch into the usual locking position.
3. Turning the actuator further by another 90° will lift the latch in linear direction by 6 mm, pulling the door leaf against the frame or the seal and generating a vibration-proof lock.

max. torque: 4.5 Nm
max. axial force: 340 N
max. static load: 340 N

For **installation**, set a bore diameter in the door as shown in the outline drawing. Once assembled, the rotary clamping latch is pushed through the bore diameter from the front. The hexagonal nut can then be pushed over the latch from the back and bolted in place.

The **installation bore diameter** in the door leaf is usually generated by punching or laser application in series production.

For small series and steel sheets below 2 mm thickness, the sheet metal punches GN 123 (see page 1493) are the tool of choice.

The installation bore diameter can also be set by drilling / milling as shown in the outline drawings.

INFORMATION

The rotary clamping latches GN 516.1 have a closing mechanism which transfers the rotary movement of the operating element (key) into a 90° turn and then into a 6 mm linear stroke.
This mechanism is designed for common applications such as making a tight and vibration-proof interlock in the end position (retaining position) in connection with the protective cap.
A 10 mm adjustment within the latch distances A1 ... A4 can be achieved by the set screw M6. This covers a latch distance from 1 to 41 mm consistently.

TECHNICAL AND ASSEMBLY INSTRUCTIONS

1. Latch in starting position.
2. The first 90° turn of the actuator / key moves the latch into the usual locking position.
3. Turning the actuator further by another 90° will lift the latch in linear direction by 6 mm, pulling the door leaf against the frame or the seal and generating a vibration-proof lock.

max. torque: 4.5 Nm
max. axial force: 340 N

Edge protection profiles and edge protection seal profiles

General notes

Introduction

Edge protection profiles are installed on the front edge of metal sheets and plates. They protect surfaces from damage by sharp edges. Meanwhile, edge protection seal profiles feature a seal profile in order to provide additional sealing for doors, covers and hatches.

Uses and applications

With the use of edge protection when handling equipment and machine parts made of sheet metal profiles, the risk of cuts or abrasions is reduced to a minimum. In the process, in these applications the profiles provide a visual "decorative effect." Other application possibilities include cable and tube laying, where openings and edges of divider plates need to be bypassed. This provides reliable protection from flaking or worn-down cables and tubes.

In general, using edge protection profiles can reduce the need for further treatment such as burring and chamfering of cut or laser-cut metal sheets.

Edge protection seal profiles provide the same benefits as edge protection profiles. However they are recommended for use in cases where doors, covers and hatches require additional sealing in order to prevent the emission of dust, warm air or noise; for example, or in order to prevent water spray from entering.

Structure

Edge protection profiles consist of an extruded clamping profile which forms the base of the structure and is used on the edge of sheet metal in order to affix the edge protection profile.

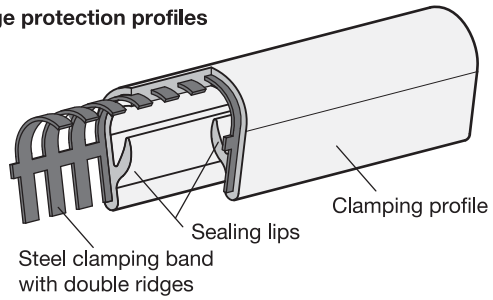
In order to increase the clamping force, the clamping profile is strengthened through a reinforcement, preventing the profile from detaching itself after assembly.

The clamp insert is available as a steel clamping band or as a steel wire polyester clamping band. Steel clamping bands have a higher clamping effect, while steel wire clamping bands allow a smaller assembly radius, also enabling a more even alignment of the edges.

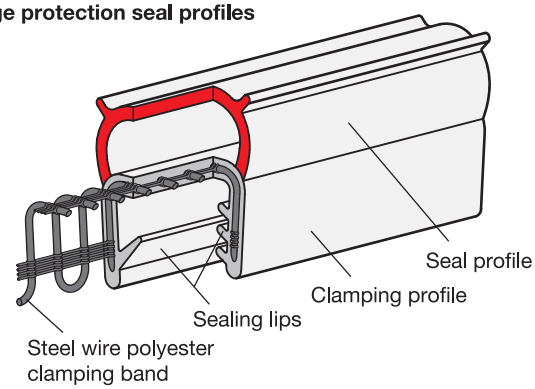
The seal profile is affixed to the top or the side of the clamping profile and is significantly "softer". It can be made from the basic material of the clamping profile but it can also be made from particular materials for specific applications. In order to attain optimum sealing, the seal profile needs to be prestressed and/or formed to enable it to adapt precisely to the countersurface.

The sealing lips in the interior of the clamping profile ensure the sealing of the edge protection seal profile with the edge of the sheet.

Edge protection profiles



Edge protection seal profiles



Assembly

Side cutters and scissors that are suitable for cutting the metal clamping insert can be used to align the profiles. Any end parts of the clamp insert that protrude from the cutting area should be removed in order to prevent injuries. The profile ends and cants can be subsequently sealed and/or glued as required.

The mounting of the profiles to the edges is secured via the clamp insert. Glue or other adhesives are not usually required.

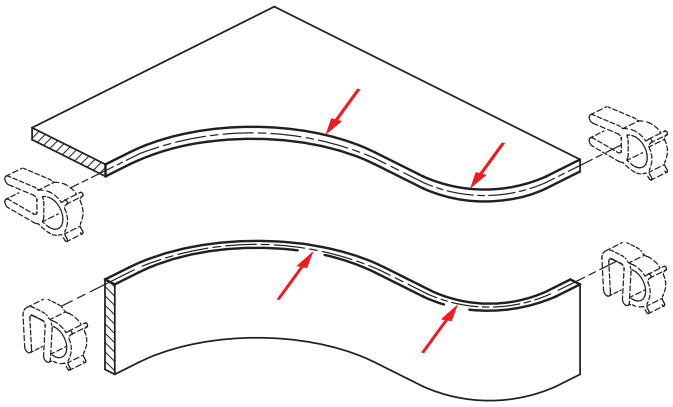
Profiles can generally be assembled by applying pressure by hand. If necessary, the profile can additionally be secured by lightly applying a soft-face hammer.

Edge protection profiles and edge protection seal profiles

Technical information

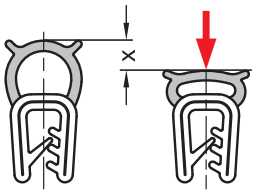
Minimum placement radii

In order to ensure a consistent seal for the profile and to prevent the profile from detaching, placement should not be set below the minimum radii. This also makes the profile assembly easier.
The radii are listed on the corresponding standard sheets and should be used as a guideline. Depending on the direction of application, a distinction is made between cut or curved radii, in other words, interior or exterior seal profiles.



Shaping

Ideally, edge protection seal profiles should maintain a deformation x of approximately 30 - 50% of the maximum value in order to ensure a reliable sealing.
Deformation of over 50% can impair seal tightness and reduce the resilience of the sealing material due to plastic deformation.



Basic materials, characteristics

Profiles can be made from various basic materials depending on the application. The table to the right summarizes the general characteristics to facilitate the choice.
Due to the multitude of chemicals, solvents etc. exact specifications are not possible, as basic materials that are fundamentally unstable can be durable in combination with specific materials and vice versa. Concentration, temperature and exposure time also play a crucial role. The customer is advised to test resistance when combining respective materials in contact with one another.

* + resistant, o conditionally resistant, – non-resistant

Characteristics	PVC	NBR	EPDM
Operational temperature min.	-40 °C	- 30 °C	- 40 °C

UL certification (Seal profiles as EPDM)

UL (Underwriters Laboratories) is an independent global company operating in safety science, similar to TÜV in Germany. Their testing is required as a priority in the US-American market.
Edge protection seal profiles GN 2180 (see page 1550) made of EPDM have a “UL-recognized component” mark. This states that the profiles can be used as components in finished products which are also intended for UL-certified use.
For customers and companies, the need for these types of certification is becoming increasingly important, as it guarantees high quality, reliable processing, and long durability, as well as reliable product safety.

Edge protection seal profiles

- Clamping profile hardness 65 ±5 Shore A
- Sealing profile hardness 25 ±5 Shore A
- temperature resistant -40 °C to 100 °C

Acrylonitrile butadiene rubber **NBR**
(only for sizes h_1 = 20.5 and 13)

- black
- Clamping profile hardness 60 ±5 Shore A
- Sealing profile hardness 25 ±5 Shore A
- temperature resistant -30 °C to 100 °C

Clamp insert
Steel wire polyester clamping band

INFORMATION

Edge protection seal profiles GN 2180 can be used to seal doors, covers and hatches. The profiles are pressed by hand onto the front of metal sheets and plates. The embedded clamp insert prevents detachment. Glue or other adhesives are not required.
When assembled, the profile should deform slightly according to w_2. This ensures an optimal seal. Adherance to the guideline placement radii (r_1... r_4) is recommended in order to ensure a tight profile seal and to make assembly easier.
The NBR profiles are recommended for use in cases where contact with fuels, oils or coolants can occur.
EPDM profiles are certified according to UL 50 and UL 94-HB and are therefore approved for the US-American and the Canadian market.

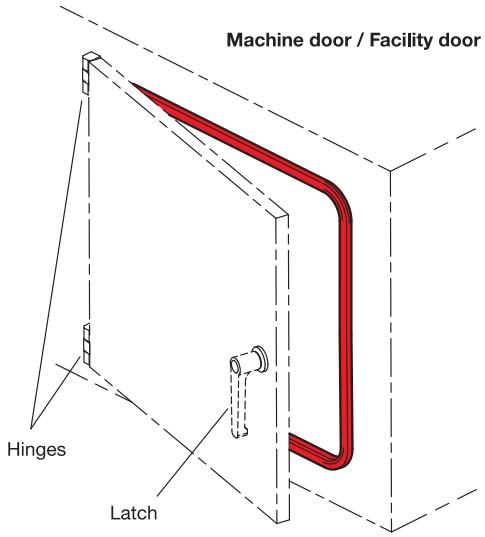
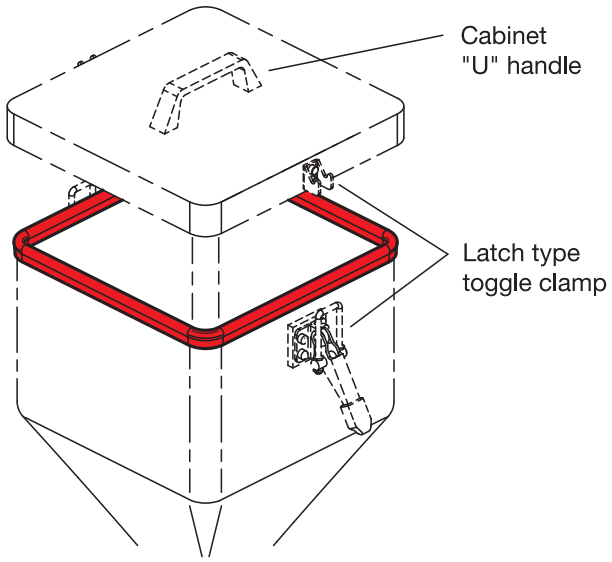
Edge protection profiles and edge protection seal profiles

Application example - profiles in combination with other Elesa+Ganter standard machine elements



Bulk container lid



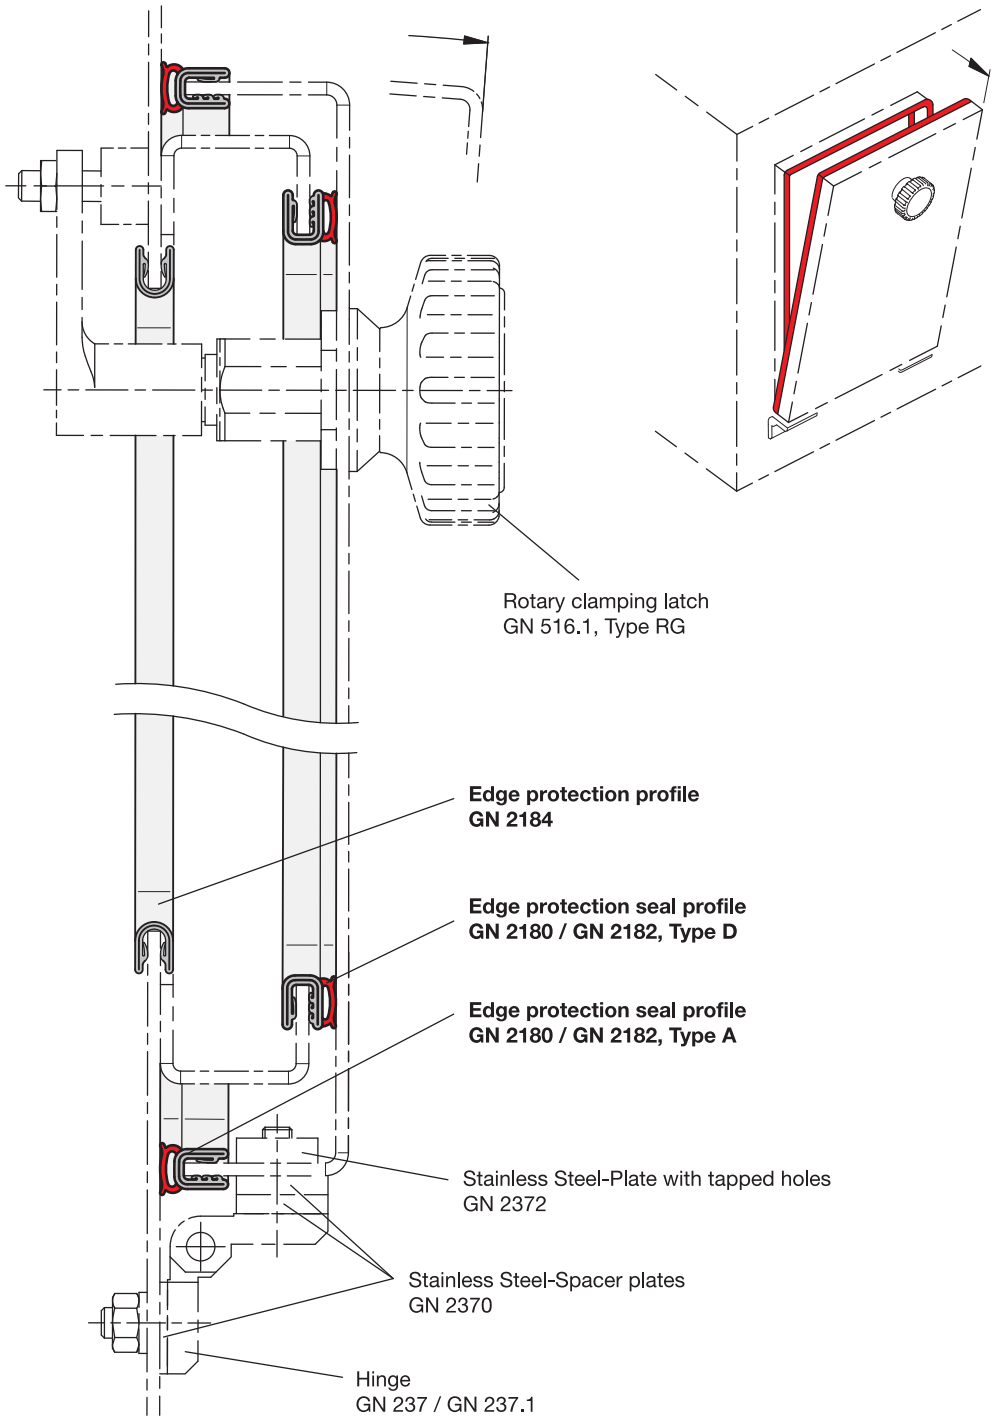
Application examples

With their versatility, edge protection profiles and/or edge protection seal profiles can be implemented in various applications, in conjunction with other Elesa+Ganter products.

- Latches (see page 1462)
- Hinges (see page 1386)
- Toggle clamps (see page 1562)

Edge protection profiles and edge protection seal profiles

Construction example



Construction examples

The construction depicted shows a standard application of edge protection profiles and edge protection seal profiles. The edge protection seal profiles are attached to the door and the fixed frame. The opening for the door is covered with and edge protectioin profile at its cut edge.

Edge protection profiles

Material PVC

SPECIFICATION

Profile
Polyvinyl Chloride (PVC)

- black **SW**
- Hardness 70 ±5 Shore A
- temperature resistant -40 °C to 90 °C
- weather exposure

Clamp insert
Steel clamping band

INFORMATION

Edge protection profiles GN 2184 are installed on the front edge of metal sheets and plates. They protect the surfaces from damage by sharp edges. The edge finish additionally achieves an optical decorative effect, while the need for potential further treatment such as burring and chamfering of cut or laser-cut metal sheets is reduced to an absolute minimum.
Adhering to the guideline placement radii (r_1...r_3) is recommended in order to guarantee permanent profile placement and to make assembly easier. Assembly can be carried out by hand, or alternatively with a soft-face hammer. The embedded clamp insert prevents it from detaching. Glue or other adhesive is not required.

TECHNICAL INFORMATION

- Technical information for edge protection profiles (see page 1548)

ON REQUEST

- Color white / grey

14 Toggle, power and hook clamps

Toggle clamps

Power clamps

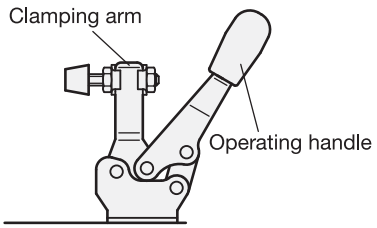
Hook clamps

Toggle clamps

Operating principle toggle link

By using the **toggle link principle** toggle clamps offer decisive advantages:

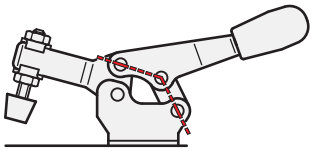
The clamping arm retracts to such an extent that the workpiece can be loaded and unloaded completely unobstructed.



Even the slightest forward movement of the operating handle brings the clamping arm with the contact pad over the workpiece.

As can be seen from the sketch, the position of the toggle links will lead to a multiple of the input force applied to the operating handle.

In this position the toggle clamp is not yet fully engaged and any counter force will open it.



In this position all three pivots are perfectly aligned yielding the maximum **clamping force F_S** (dead centre point).

The clamping force F_S exerted on the workpiece is mainly dependent on the following criteria:

- the input force which is applied to the operating handle,
- the position of the clamping bolt on the clamping lever.

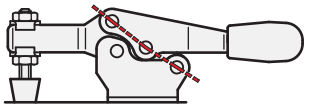
Since the applied force on the lever by the operator is not known, the clamping force F_S shown in the table is only specified for pneumatically operated clamps.

The clamping force F_S can be altered by re-adjusting the position of the clamping bolt. The clamping force increases if the entire contact area of the bolt arrives on the workpiece prior to the toggle linkage reaching dead centre point. This effect is illustrated clearly when using an elastic clamping pad.

In this position the toggle linkage has arrived in the over-centre lock position and the operating lever has reached a firm stop and is thus prevented from opening until it is released by the operator.

The force which the clamp is capable of withstanding in this over-centre lock position without suffering permanent deformation is known as holding force F_H. The holding force has a characteristic value (co-efficient) for toggle clamps and this value is mainly dependent on:

- the size (dimensions, geometry) of the toggle clamp,
- the position of the clamping bolt on the clamping arm



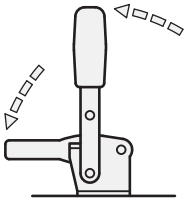
In the tables the **holding force F_H** of the toggle clamps is given in each case in relation to a particular position (distance r) of the clamping arm.

On the standard sheets all clamps are shown in their clamping position.
All references to force are given in N (Newton).

Toggle clamps
Types

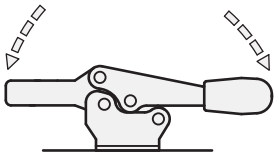
Vertical acting toggle clamps

Lever and clamping bar move in the same direction.
In the clamped position the operating handle is in vertical position.
For applications where substantial forces and many tightening cycles occur, „Longlife“ versions are available.



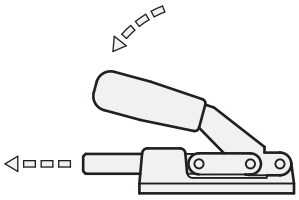
Horizontal acting toggle clamps

Lever and clamping bar move in opposite direction.
In the clamped position the operating handle is in horizontal position (flat version).



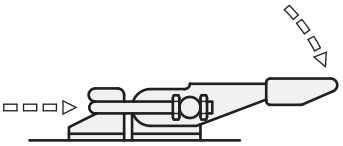
Push-pull type toggle clamps

On these clamps the swinging movement of the operating handle is converted into an axial movement to push or pull the plunger.
With the exception of two versions (GN 841 see page 1588) , they lock at the end of their stroke in both directions. For this reason they lend themselves for push or pull operations.



Latch type toggle clamps

On these clamps the swinging movement of the operating handle is converted into an axial movement to pull the hook.
Latch clamps are available with and without locking mechanism.

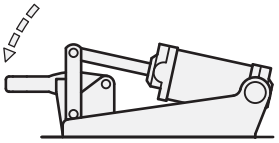


Pneumatic toggle clamps

These toggle clamps combine the advantages of clamping by the toggle principle (clamp remains in the clamping position even in the event of air pressure loss!) with the advantages offered by pneumatics i.e.:

- constant clamping force Fs independent of the operator,
- several clamps can be operated simultaneously,
- pneumatic toggle clamps can be energised from various operating points (remote control, co-ordinated and controlled by other machines),
- some variants are available with an air cylinder which allows control via a proximity switch, to give an electrical impulse when the clamp has reached a specific position within its clamping cycle.

Pneumatic toggle clamps are available as vertical and push rod versions.



Vertical acting toggle clamps

Steel / Stainless Steel, with horizontal mounting base

SPECIFICATION

Types

- Type **A**: U-bar version, with two flanged washers
- Type **C**: U-bar version, with two flanged washers and GN 708.1 spindle assembly (see page 1625)
- Type **E**: Solid bar version, with clasp

Version in Steel

- Case-hardened Steel C10, zinc plated, blue passivated
- Bearing pins tempered
- Bearing rivets (for size 230 and up), case-hardened

All moving parts
lubricated with special grease

Hand grip
High quality, oil resistant red plastic

Spindle assembly GN 708.1 , Type A (see page 1625)

- Steel, zinc plated
- Rubber tip 85 Shore A

Version in Stainless Steel NI

Stainless Steel AISI 304

All moving parts
lubricated with special grease

Hand grip
High quality, oil resistant red plastic

Spindle assembly GN 708.1 , Type A (see page 1625)

- Stainless Steel AISI 304
- Rubber tip 85 Shore A

ACCESSORY

- Spindle assemblies (see page 1623)
- GN 801 clamp mounts for toggle clamps (for Type A) (see page 1629)
- GN 809 clamp mounts for toggle clamps (for Type E) (see page 1630)

INFORMATION

GN 810 vertical acting toggle clamps work according to the toggle principle: lever and clamping bar move in the same direction. In the clamped position the operating lever is in its vertical position.
Vertical acting toggle clamps in the U-bar version with two flanged washers (Type A) can accommodate an application specific clamping screw. A spindle assembly with neoprene rubber tip is also included for Type C.
Type E version can either be utilized by welding the clasp which can then accommodate an application specific hold-down fastener component, or by utilizing the bar in conjunction with the GN 809 (see page 1630) clamp mounts to hold the work piece in place.

- General information for toggle clamps (see page 1560)

Vertical acting toggle clamps

Steel / Stainless Steel, with vertical mounting base

SPECIFICATION

Types

- Type **B**: U-bar version, with two flanged washers
- Type **BC**: U-bar version, with two flanged washers and GN 708.1 spindle assembly (see page 1625)
- Type **F**: Solid bar version, with clasp

Version in Steel

- Case-hardened Steel C10, zinc plated, blue passivated
- Bearing pins tempered
- Bearing rivets (for size 230 and up), case-hardened

All moving parts
lubricated with special grease

Hand grip
High quality, oil resistant red plastic

Spindle assembly GN 708.1 , Type A (see page 1625)

- Steel, zinc plated
- Rubber tip 85 Shore A

Version in Stainless Steel NI

Stainless Steel AISI 304

All moving parts
lubricated with special grease

Hand grip
High quality, oil resistant red plastic

Spindle assembly GN 708.1 , Type A (see page 1625)

- Stainless Steel AISI 304
- Rubber tip 85 Shore A

ACCESSORY

- Spindle assemblies (see page 1623)
- GN 801 clamp mounts for toggle clamps (for Type B) (see page 1629)
- GN 809 clamp mounts for toggle clamps (for Type F) (see page 1630)

INFORMATION

GN 810.1 vertical acting toggle clamps work according to the toggle principle: lever and clamping bar move in the same direction. In the clamped position the operating lever is in its vertical position.
Vertical acting toggle clamps in the U-bar version with two flanged washers (Type B) can accommodate an application specific clamping screw. A spindle assembly with neoprene rubber tip is also included for Type BC.
Type F version can either be utilized by welding the clasp which can then accommodate an application specific hold-down fastener component, or by utilizing the bar in conjunction with the GN 809 (see page 1630) clamp mounts to hold the work piece in place.

- General information for toggle clamps (see page 1560)

GN 910

Heavy duty vertical acting toggle clamps

with horizontal mounting base „Longlife“

SPECIFICATION

Types

- Type **A**: Clamping arm with slotted hole (only sizes 220 and 440)
- Type **E**: Clamping arm with bushing

Toggle clamp steel

- Precision casting
- blackened

Lever arm steel

- forged
- blackened

Parts in sheet metal

- case-hardened steel
- blackened

Bearing pins and rivets steel
hardened and ground

All moving parts
lubricated with special grease

Hand grip
High quality, oil resistant red plastic

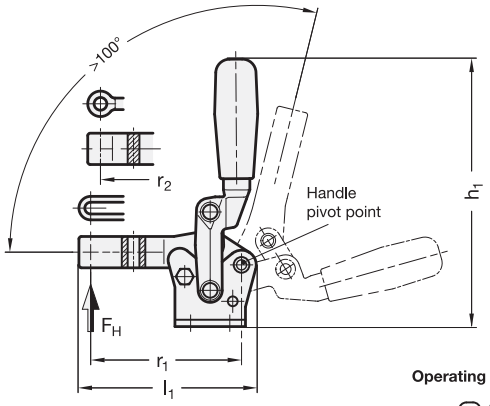
INFORMATION

GN 910 heavy duty vertical acting toggle clamps "Longlife" are an advanced development of GN 810 (see page 1562): The steel sheet design of the clamp and lever arms is replaced by precision or die-forged components. The remaining steel sheet parts have been reinforced, bearing pins and rivets are hardened and ground.
These vertical clamps are therefore suitable for applications in which substantial forces occur and in which a long service life is required.
Extensive tests have shown that trouble-free function (under load) is ensured also after one million clamping cycles.
Stepped side washers are included.

- General information for toggle clamps (see page 1560)

ACCESSORY

- Spindle assemblies (see page 1623)



Operating principle

Heavy duty knee lever modules

with horizontal or vertical mounting base, to screw-on

SPECIFICATION

Types

- Type **C**: Mounting holes vertical to the handle pivot point
- Type **G**: Mounting holes parallel to the handle pivot point

Lever arm steel

- forged
- blackened

Parts in sheet metal

- case-hardened steel C10
- blackened

Bearing pins and rivets steel
hardened and ground

All moving parts
lubricated with special grease

INFORMATION

GN 910.2 heavy duty knee lever modules have the same properties and attributes as the "Longlife" GN 910 (see page 1566) / GN 910.1 (see page 1567) heavy duty vertical acting toggle clamps: The clamping arms are die-forged, the remaining steel sheet parts have been reinforced and bearing pins and rivets are hardened and ground.
These knee lever modules are therefore suitable for applications in which substantial forces occur and in which a long service life is required.
Extensive tests have shown that trouble-free function (under load) is ensured also after one million clamping cycles.
These knee lever modules permit the size and position of the lever and clamping arms to be adjusted to match the specific application.
- General information for toggle clamps (see page 1560)

ACCESSORY

- Handles, levers, clamping arm extenders, bushings, base plates (see page 1570)

GN 910.3

Heavy duty knee lever modules

for welding

SPECIFICATION

Lever arm steel

- forged
- blackened

Parts in sheet metal

- case-hardened steel C10
- blackened

Bearing pins and rivets steel
hardened and ground

All moving parts
lubricated with special grease

INFORMATION

GN 910.3 heavy duty knee lever modules have the same properties and attributes as the "Longlife" GN 910 (see page 1566) / GN 910.1 (see page 1567) heavy duty vertical acting toggle clamps: The clamping arms are die-forged, the remaining steel sheet parts have been reinforced and bearing pins and rivets are hardened and ground.
These knee lever modules are therefore suitable for applications in which substantial forces occur and in which a long service life is required.
Extensive tests have shown that trouble-free function (under load) is ensured also after one million clamping cycles.
These knee lever modules permit the size and position of the lever and clamping arms to be adjusted to match the specific application.
The actual module is welded on.

- General information for toggle clamps (see page 1560)

ACCESSORY

- Handles, levers, clamping arm extenders, bushings, base plates (see page 1570)

GN 813

Heavy duty vertical acting toggle clamps

with vertical mounting base

SPECIFICATION

Type

- Type **F**: Solid bar version

Bearing pins and clamping lever
Steel St 60
blackened

Other parts
Steel St 37

- weldable
- blackened

Bearing pins and rivets
case-hardened

All moving parts
lubricated with special grease

Hand grip
High quality, oil resistant red plastic

INFORMATION

GN 813 vertical acting toggle clamps are used for applications where a very high holding force is required such as closing of foam molds. These clamps have been designed for easy dismantling: i.e. the bearing pins are locked with circlips.
After dismantling the individual parts, they can be modified to suit individual applications.

- General information for toggle clamps (see page 1560)

Vertical acting toggle clamps

with dual flanged mounting base

SPECIFICATION

Types

- Type **AV**: U-bar version, with two flanged washers
- Type **CV**: U-bar version, with two flanged washers and GN 708.1 spindle assembly (see page 1625)
- Type **EV**: Solid bar version, with clasp

Parts in sheet metal
Case-hardened Steel C10, zinc plated, blue passivated

Bearing pins tempered

Bearing rivets case-hardened

All moving parts
lubricated with special grease

Hand grip
High quality, oil resistant red plastic

Spindle assembly GN 708.1 , Type A (see page 1625)

- Steel, zinc plated
- Rubber tip 85 Shore A

INFORMATION

GN 812 vertical acting toggle clamps work according to the toggle principle: lever and clamping bar move in the same direction. They can be mounted in two planes via the dual flanged mounting base and require less space for the clamping action because the clamping arm and the operating lever move in opposite directions.
Vertical acting toggle clamps in the U-bar version with two flanged washers (Type AV) can accommodate an application specific clamping screw. A spindle assembly with neoprene rubber tip is also included for Type CV.
Type EV version can either be utilized by welding the clasp which can then accommodate an application specific hold-down fastener component, or by utilizing the bar in conjunction with the GN 809 (see page 1630) clamp mounts to hold the work piece in place.

- General information for toggle clamps (see page 1560)

ACCESSORY

- Spindle assemblies (see page 1623)
- GN 801 clamp mounts for toggle clamps (for Type AV) (see page 1629)
- GN 809 clamp mounts for toggle clamps (for Type EV) (see page 1630)

Horizontal acting toggle clamps

Steel / Stainless Steel, with horizontal mounting base

SPECIFICATION

Types

- Type **M**: U-bar version, with two flanged washers
- Type **MC**: U-bar version, with two flanged washers and GN 708.1 spindle assembly (see page 1625)
- Type **O**: Solid bar version, with clasp

Version in Steel

- Case-hardened Steel C10, zinc plated, blue passivated
- Bearing pins tempered
- Bearing rivets (for size 355 and up), case-hardened

All moving parts
lubricated with special grease

Hand grip
High quality, oil resistant red plastic

Spindle assembly GN 708.1 , Type A (see page 1625)

- Steel, zinc plated
- Rubber tip 85 Shore A

Version in Stainless Steel NI

Stainless Steel AISI 304

All moving parts
lubricated with special grease

Hand grip
High quality, oil resistant red plastic

Spindle assembly GN 708.1 , Type A (see page 1625)

- Stainless Steel AISI 304
- Rubber tip 85 Shore A

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

ACCESSORY

- Spindle assemblies (see page 1623)
- GN 809 clamp mounts for toggle clamps (for Type O) (see page 1630)
- GN 801 clamp mounts for toggle clamps (for Type M) (see page 1629)

INFORMATION

GN 820 horizontal acting toggle clamps work according to the toggle principle: lever and clamping bar move in the opposite direction.
They require less space for the clamping action. In the clamped position the operating lever is in its horizontal position.
Horizontal acting toggle clamps in the U-bar version with two flanged washers (Type M) can accommodate an application specific clamping screw. A spindle assembly with neoprene rubber tip is also included for Type MC.
Type O version can either be utilized by welding the clasp which can then accommodate an application specific hold-down fastener component, or by utilizing the bar in conjunction with the GN 809 (see page 1630) clamp mounts to hold the work piece in place.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

ACCESSORY

- Spindle assemblies (see page 1623)
- GN 801 clamp mounts for toggle clamps (for Type ML) (see page 1629)
- GN 809 clamp mounts for toggle clamps (for Type OL)

INFORMATION

GN 820.3 horizontal acting toggle clamps have a safety function whereby, during closing, a spring loaded safety hook latch ensures a secure locking connection. It prevents the inadvertent unlocking of the clamp due to vibrations or an accidental attempt of loosening / opening of the clamp. To open and release the clamp, pull up on the finger grip to disengage the safety hook latch mechanism (one hand operation).
They work according to the toggle principle: lever and clamping bar move in the opposite direction. They require less space for the clamping action.
Horizontal acting toggle clamps in the U-bar version with two flanged washers (Type ML) can accommodate an application specific clamping screw. A spindle assembly with neoprene rubber tip is also included for Type MLC.
Type OL version can either be utilized by welding the clasp which can then accommodate an application specific hold-down fastener component, or by utilizing the bar in conjunction with the GN 809 ( ) clamp mounts to hold the work piece in place.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

ACCESSORY

- Spindle assemblies (see page 1623)
- GN 801 clamp mounts for toggle clamps (for Type MF) (see page 1629)

INFORMATION

GN 820.2 horizontal acting toggle clamps work according to the toggle principle: lever and clamping bar move in the opposite direction.
They require less space for the clamping action. In the clamped position the operating lever is in its horizontal position. The 90° rotated mounting surface allows a space-saving installation in addition to the clamping point.
Horizontal acting toggle clamps in the U-bar version with two flanged washers (Type MF) can accommodate an application specific clamping screw. A spindle assembly with neoprene rubber tip is also included for Type MFC.

- General information for toggle clamps (see page 1560)

GN 840

Push-pull type toggle clamps

for push-pull clamping

SPECIFICATION

Types

- Type **ASD**: Clamping by turning handle counter-clockwise
- Type **ASS**: Clamping by turning handle clockwise

Parts in sheet metal
Case-hardened Steel C10
zinc plated, blue passivated

Plunger
Steel St 37
zinc plated, blue passivated

Plunger guide bushing
Steel St 37
zinc plated, blue passivated

All moving parts
lubricated with special grease

Hand grip
High quality, oil resistant red plastic

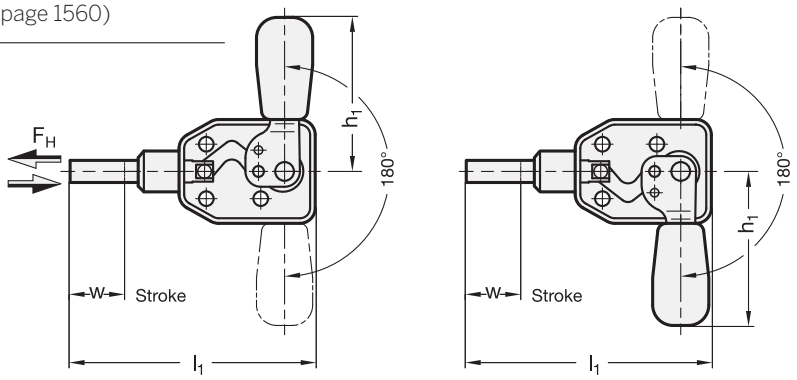
INFORMATION

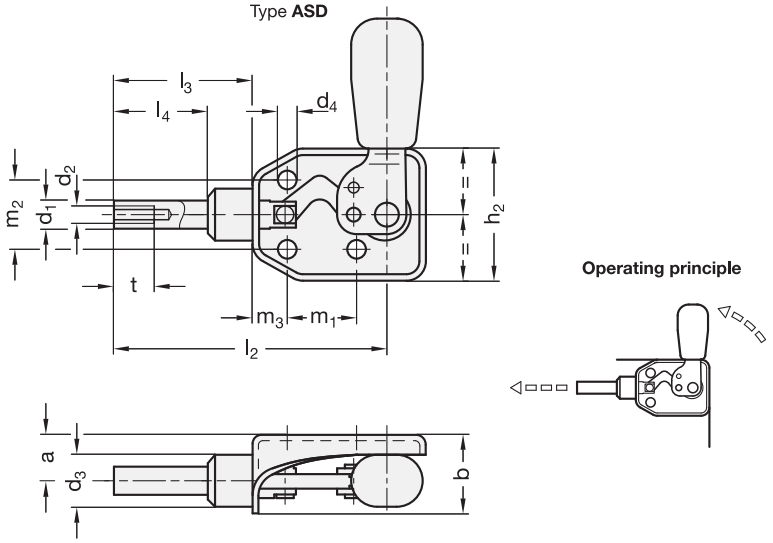
GN 840 push-pull type toggle clamps are known for their extremely low height regardless of the position of the operating handle.

- General information for toggle clamps (see page 1560)

ACCESSORY

- Spindle assemblies (see page 1623)





Type **ASS** is mirror image of type ASD

GN 840

GN 844

Heavy duty push-pull type toggle clamps

for push-pull clamping

SPECIFICATION

Types

- Type **ASD**: Clamping by turning handle counter-clockwise
- Type **ASS**: Clamping by turning handle clockwise

Body
Brass: size 70
Steel: from size 160

- forged
- black lacquered

Parts in sheet metal
Case-hardened Steel C10
zinc plated, blue passivated

Plunger
Steel St 37
zinc plated, blue passivated

All moving parts
lubricated with special grease

Hand grip
High quality, oil resistant red plastic

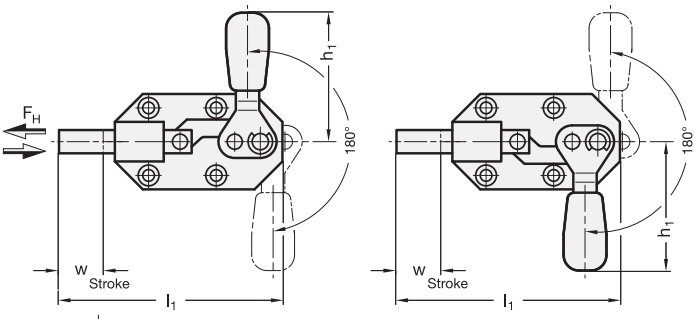
INFORMATION

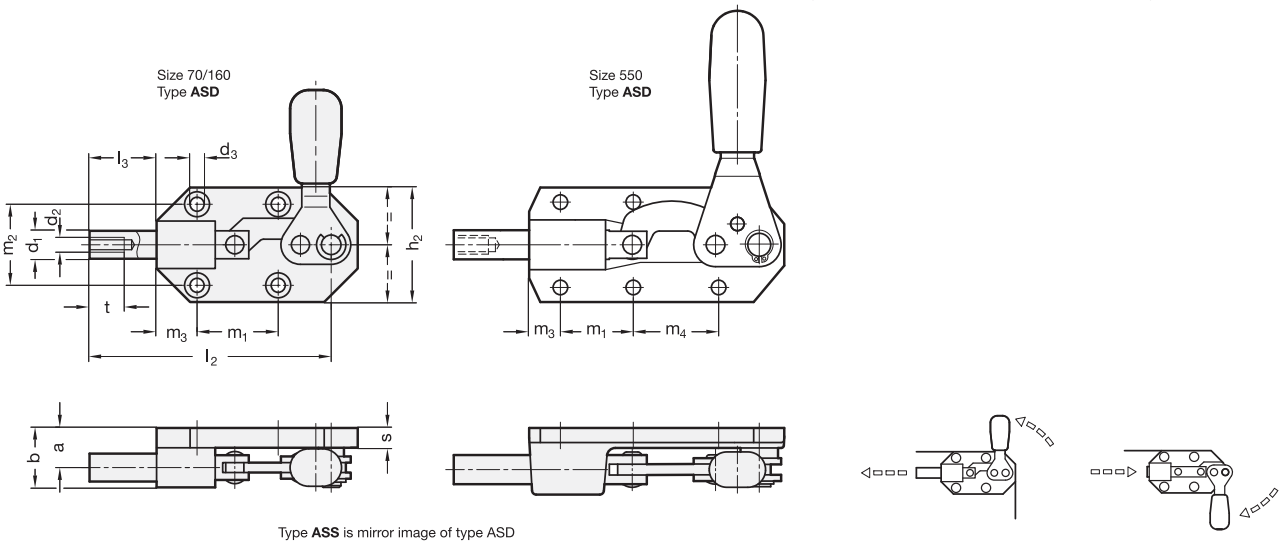
GN 844 heavy duty push-pull type toggle clamps are known for their low height in all clamping positions. They can be used for very high holding forces thanks to their massive and sturdy body.

- General information for toggle clamps (see page 1560)

ACCESSORY

- Spindle assemblies (see page 1623)





Type **ASS** is mirror image of type ASD

Handle with plastic sleeve
red, oil resistant

Version in Stainless Steel A4

Sheet metal parts / U-bolt latch / Pin
Stainless Steel AISI 316L

All moving parts
lubricated with special grease

Handle with plastic sleeve
red, oil resistant

INFORMATION

GN 851.3 horizontal latch type toggle clamps are compact in design and can be used to ensure high holding capacities.
When closing the spanner, a safety hook positively locks onto the body. This prevents the inadvertent or vibration-induced release from the clamping position. To open the safety hook it is unlocked per one-hand operation.
The stroke of the U-bolt latch can be adjusted within its range.
In addition to the standard lengths for the U-bolt latch shown above, more lengths may be achieved by using series GN 951.1 square U-bolts (see page 1604).

- General information for toggle clamps (see page 1560)

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

Vertical latch type toggle clamps

Steel / Stainless Steel, for pulling action

SPECIFICATION

Types

- Type **T3**: with U-bolt latch, with catch
- Type **T**: without U-bolt latch, with catch

Version in Steel

Case-hardened Steel C10
zinc plated, blue passivated

U-bolt latch
Steel St 37
zinc plated, blue passivated

All moving parts
lubricated with special grease

Handle with plastic sleeve
red, oil resistant

Version in Stainless Steel NI

Parts in sheet metal / U-bolt latch
Stainless Steel AISI 304

Pin
Stainless Steel AISI 303

All moving parts
lubricated with special grease

Handle with plastic sleeve
red, oil resistant

INFORMATION

The stroke of the U-bolt latch of GN 851.1 vertical latch type toggle clamps can be adjusted within its range.
In the clamped position the U-bolt latch with clamping arm is perpendicular to the clamping arm and the plane of the operating handle.
In addition to the standard lengths of the U-bolt latches shown in the table, a variety of other lengths are also available under the GN 951.1 series (see page 1604).

- General information for toggle clamps (see page 1560)

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

INFORMATION

GN 852 heavy duty latch type toggle clamps are used for very high holding forces as may be required in plastic high pressure mold forming.
The stroke of the U-bolt latch can be adjusted within its range.
In addition to the standard lengths of the U-bolt latches shown in the table, a variety of other lengths are also available under the GN 951.2 series (see page 1605).

- General information for toggle clamps (see page 1560)

Latch type toggle clamps

Steel / Stainless Steel, with safety hook, heavy duty type

SPECIFICATION

Types

- Type **T6**: with mounting holes, with U-bolt latch, with catch
- Type **T**: with mounting holes, without U-bolt latch, with catch
- Type **T6S**: for welding, with U-bolt latch, with catch
- Type **TS**: for welding, without U-bolt latch, with catch

Version in Steel

Body / catch / clamping lever
Steel C22

- forged
- black lacquered (Type T6 / T)
- blackened (Type T6S / TS)

U-bolt latch / bearing pin
Steel St 37
zinc plated, blue passivated

All moving parts
lubricated with special grease

Version in Stainless Steel NI

Body / catch / clamping lever / U-bolt latch
Stainless Steel AISI 304
forged

Other parts
Stainless Steel AISI 303

All moving parts
lubricated with special grease

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

INFORMATION

GN 852.3 latch type toggle clamps are compact in design and can be used to ensure high holding capacities.
When closing the spanner, a safety hook positively locks onto the body. This prevents the inadvertent or vibration-induced release from the clamping position. To open the safety hook it is unlocked per one-hand operation.
The stroke of the U-bolt latch can be adjusted within its range.
In addition to the standard lengths of the U-bolt latches shown in the table, a variety of other lengths are also available under the GN 951.1 series (see page 1604).

- General information for toggle clamps (see page 1560)

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

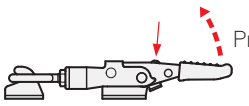
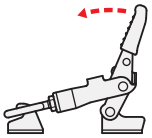
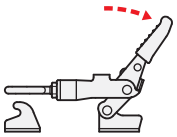
DESCRIPTION OF FUNCTION (FOR ONE-HAND OPERATION)



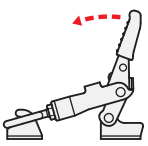
Press the release button for **releasing**.



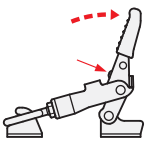
Lift the clamping arm until the latch bolt disengages from the catch.



Retracting the clamping arm will lift the latch bolt and release the catch (one-hand operation).



For **clamping operation**, lift the clamping arm until it rests on the catch.



The clamping arm engages in the catch if the release button is pressed for the clamping operation.
When clamping in the end position, the system locks automatically by spring force.

INFORMATION

GN 853 latch type toggle clamps feature a locking mechanism which prevents an inadvertent or vibration-induced opening of the clamp. Another benefit is the option of operating the clamp with one hand.

Catch
Sheet metal steel
blank

INFORMATION

The outstanding feature of GN 854 latch type toggle clamps is their highly robust, sturdy and compact design, allowing their use under demanding conditions, e.g. exposure to high temperatures, dust, spray mist, etc.
The specially designed catch allows the forced loosening of the clamping by the clamping arm moving the U-bolt latch forward, e.g. for separating mould halves.
Latch type toggle clamps with bore (coding 1) are operated with a gear lever handle which is plugged into the latch and pulled off after operation. This saves space and has the added advantage that the gear lever handle is not exposed to adverse ambient conditions, e.g. becoming too hot to operate. The gear lever handle is not included in the delivery.
The catch can also be attached using screws or bolts.
If required, clamps and U-bolt latches are also available as separate parts; for replacement, the bearing pin is easily dismantled.

SPECIFICATION

Type
- Type **C2**: for screwing

Clamp / operating handle
Steel
- forged
- blackened

Bearing flange
Sheet steel, blackened

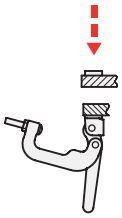
Spindle assembly
Steel, blackened

Counter plate / bearing pin
Steel, blackened

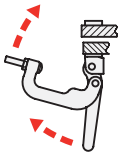
INFORMATION

GN 855 C-clamps feature an especially robust, sturdy and compact design, allowing them to be used under severe and demanding conditions, e.g. higher temperatures, dust, mist, etc.
The C-clamps are normally installed and mounted at the clamping point. The counter plate (supplied loose) has a ball socket and is designed for attaching to the counter piece to be clamped. In connection with the ball-type bolt, this configuration ensures the precise positioning of the latch clamp.
If the counter plate is not to remain at the counter piece to be clamped, the clamping bracket may alternatively also be used to hold GN 802 (see page 1626) toggle clamp spindle assemblies which have a pendulum-type bearing surface.

DESCRIPTION OF FUNCTION



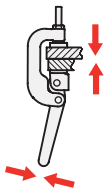
Place the pieces to be clamped into the clamping position, e.g. close the lid or place the piece to be clamped on top.



Then move the clamping bracket and the operating handle of the C-clamp upwards.

Now move the clamping bracket forward such that the clamping bolt is located in the ball socket of the counter plate.

Move the operating handle downwards until the clamping force has exceeded the dead point.



When closed, the C-clamp now holds its position on its own.

Latch type toggle clamps
with locking mechanism

SPECIFICATION

Type
- Type **T5**: with fixing holes (d2)

Steel forged / precision die casting
chemically blackened

Bearing pins steel
hardened and ground

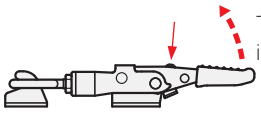
All moving parts
lubricated with special grease

Hand grip
High quality, oil resistant red plastic

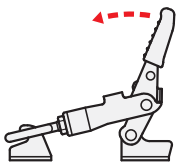
INFORMATION

GN 858 latch type toggle clamps are used when very high retaining forces are required.
The latch type clamp also features a locking mechanism which prevents the inadvertent or vibration-induced opening of the clamp.
Another benefit of this clamp is the ability to operate it with one hand.
Catch is included.
- General information for toggle clamps (see page 1560)

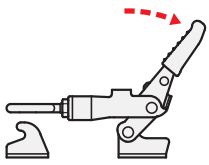
DESCRIPTION OF FUNCTION (FOR ONE-HAND OPERATION)



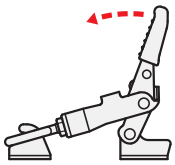
To **release**, move the locking mechanism in the direction of the arrow.



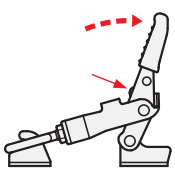
Lift the lever arm until the latch bolt is disengaged from the catch.



Moving the lever arm back will lift the latch bolt and release the catch (one-hand operation).



For **clamping**, lift the lever arm until the latch bolt rests against the catch.



The latch bolt engages with the catch if the locking mechanism is moved upward during clamping.
When clamping in the end position, the mechanism locks automatically through spring tension.

GN 861

Heavy duty pneumatic toggle clamps

with magnetic piston

SPECIFICATION

Type
- Type **EP**: solid clamping arm

Coding
- Coding **M**: Magnetic piston

Base
cast steel
black lacquered

other parts
Steel St 60
zinc plated, blue passivated

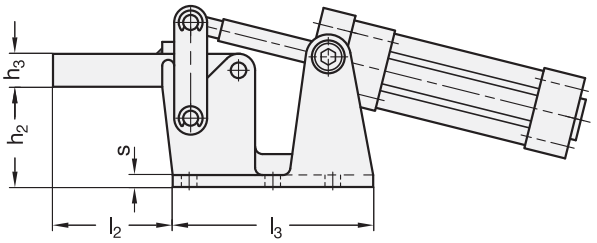
Bearing pins
case hardened

Double-action air cylinder
with adjustable cushioning
max. pressure 6 bar

All moving parts
lubricated with special grease

INFORMATION

GN 861 heavy duty pneumatic toggle clamps have been constructed in such a way as to make them easy to unmount. The bearing pins are axially fixed with circlips. This allows the clamping arm to be modified to suit any particular application.
To ensure an extended life of the mechanical parts as well as the air cylinder the operating pressure should not exceed 6 bar. In addition a lubrication control unit should be fitted in the air line.
GN 861 pneumatic toggle clamps are available as version M (magnetic piston). In conjunction with a GN 896.3 (see page 1622) proximity switch the piston position is sensed and the generated signal can be used in sequence control systems.
- General information for toggle clamps (see page 1560)



ACCESSORY

- GN 896.3 proximity switch (see page 1622)

SPECIFICATION

Types

- Type **AP3**: U-bar version, with two flanged washers
- Type **CP3**: U-bar version, with two flanged washers and GN 708.1 spindle assembly (see page 1625)
- Type **EP3**: Solid bar version, with clasp

Coding

- Coding **M**: Magnetic piston (for size 200 and up)

Parts in sheet metal
case-hardened steel C10
zinc plated, blue passivated

Bearing pins
hardened

Bearing rivets (for size 200 and up)
case-hardened

Air cylinder bearing pins
case-hardened

Double-action air cylinder
max. pressure 6 bar

All moving parts
lubricated with special grease

Spindle assembly GN 708.1 , Type A (see page 1625)

- Steel, zinc plated
- Rubber tip 85 Shore A

INFORMATION

The clamping principle of GN 860 pneumatic toggle clamps is identical in construction and dimensions to the manually operated GN 810 vertical toggle clamps (see page 1562).
To ensure an extended life of the mechanical parts as well as the air cylinders the operating pressure should not exceed 6 bar.
GN 860 pneumatic toggle clamps are also available in sizes 200 and up as a version M (magnetic piston). In conjunction with GN 896.1 / GN 896.2 (see page 1622) proximity switches, the piston position can be sensed and the generated impulse can be used to transmit an electrical signal.

- General information for toggle clamps (see page 1560)

ACCESSORY

- Spindle assemblies (see page 1623)
- GN 801 clamp mounts for toggle clamps (for Type AP3) (see page 1629)
- GN 809 clamp mounts for toggle clamps (for Type EP3) (see page 1630)
- GN 896.1 proximity switch (see page 1622)
- GN 896.2 proximity switch (see page 1622)

- Rubber tip 85 Shore A

INFORMATION

GN 862.1 pneumatic toggle clamps are built from the same construction as GN 862 (see page 1616).
The special features of these clamps are that they can be mounted in two different planes, and they can also be operated manually via the grip handle. For example, they can individually be manually closed, and then all clamps can be opened at once via the pneumatic function.
To ensure an extended life of the mechanical parts as well as the air cylinders the operating pressure should not exceed 6 bar.
GN 862.1 pneumatic toggle clamps are also available as a version M (magnetic piston). In conjunction with a GN 896.2 (see page 1622) proximity switch, the piston position can be sensed and the generated impulse can be used to transmit an electrical signal.

- General information for toggle clamps (see page 1560)

Heavy duty pneumatic toggle clamps

with magnetic piston

SPECIFICATION

Type
- Type **EPV**: solid clamping arm

Coding
- Coding **M**: Magnetic piston

Body
cast steel
black lacquered

other parts
Steel St 60
zinc plated, blue passivated

Bearing pins
case-hardened

Double-action air cylinder
with adjustable cushioning
max. pressure 6 bar

All moving parts
lubricated with special grease

INFORMATION

GN 863 heavy duty pneumatic toggle clamps have been constructed in such a way as to make them easy to unmount: The bearing pins are axially fixed with circlips. This allows the clamping arm to be modified once it is dismantled, to suit any particular application.
To ensure an extended life of the mechanical parts as well as the air cylinder the operating pressure should not exceed 6 bar. In addition a lubrication control unit should be fitted in the air line.
GN 863 pneumatic toggle clamps are available as version M (magnetic piston). In conjunction with a GN 896.3 (see page 1622) proximity switch the piston position is sensed and the generated signal can be used in sequence control systems.
- General information for toggle clamps (see page 1560)

ACCESSORY

- GN 896.3 proximity switch (see page 1622)

GN 890

Pneumatic toggle clamps

for push-pull clamping

SPECIFICATION

Type

- Type **SP3**: Body, Steel forged

Coding

- Coding **M**: Magnetic piston (for size 360 and up)

Body
Steel

- forged
- chemically blackened

Parts in sheet metal
Case-hardened Steel C10
zinc plated, blue passivated

Tapped connecting rod
Steel St 37
zinc plated, blue passivated

Bearing pins (Bearing rivets)
case-hardened

Double-action air cylinder
max. pressure 6 bar

All moving parts
lubricated with special grease

INFORMATION

The working principle of the GN 890 pneumatic toggle clamps is identical in construction and dimensions to the manual toggle clamps GN 842 (see page 1589). To ensure an extended life of the mechanical parts as well as the air cylinders the operating pressure should not exceed 6 bar.
In addition a lubrication control unit should be fitted in the air line. The sturdy mounting frame for the cylinder has been designed to avoid the trunions of the cylinder to protrude over the frame.
GN 890 pneumatic toggle clamps are also available in sizes 360 and up as a version M (magnetic piston). In conjunction with GN 896.1 (see page 1622) / GN 896.2 (see page 1622) proximity switches, the piston position can be sensed and the generated impulse can be used to transmit an electrical signal.

- General information for toggle clamps (see page 1560)

ACCESSORY

- GN 896.1 proximity switch (see page 1622)
- GN 896.2 proximity switch (see page 1622)

Proximity switch

with mounting bracket

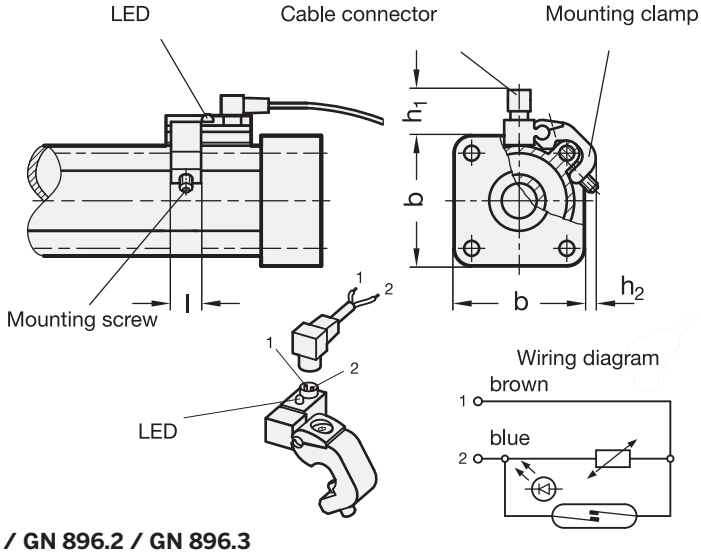
SPECIFICATION

Electric cable PVC 2 wires, 2.5 m.
If used on DC brown wire to be connected to +,
for the diode to work.

INFORMATION

With GN 896.1, GN 896.2 and GN 896.3 proximity switches the pneumatically operated clamps can emit control signals. To do this the clamps must be assembled with a special cylinder with magnetic piston which will cause the electric contacts in the REED switch to close.
The proximity switches with their mounting brackets can be set anywhere along the full stroke length of the cylinder.

Mounting **GN 896.1 / GN 896.2**



Mounting **GN 896.3**

Insert the thinner part of the proximity switch into the provided slot, turn 90° and affix inside the slot via the mounting screw.

GN 804

Toggle clamp spindle assemblies

with adjustable spring loaded thrust pad

SPECIFICATION

Spindle
Steel

- Tensile strength class 5.8
- zinc plated, blue passivated

Hexagon nuts ISO 4032
Steel
zinc plated, blue passivated

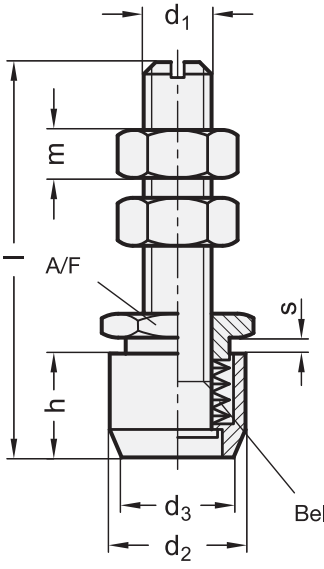
Thrust pad
Steel
nitrided, blackened

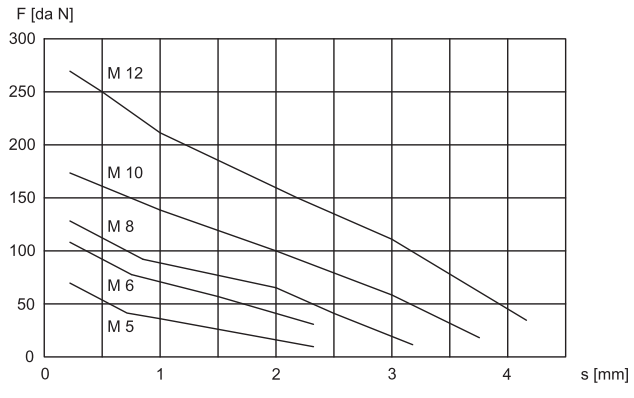
INFORMATION

In order to pass the dead centre point and / or compensate for work piece tolerances when using hand operated toggle clamps, an elastic thrust pad such as GN 708.1 (see page 1625) can be used.
GN 804 toggle clamp spindle assemblies fitted with Belleville spring washers do not only help to overcome workpiece tolerances but they also allow presetting of the required clamping force.
This adjustment can be made with the hexagon nut (A/F). The setting nut stroke is the distance by which the Belleville spring washers can be preloaded as shown on the graph to give the required clamping force.
The thrust pad is movable.
The two hexagon nuts are included parts of the order.

TECHNICAL INFORMATION

- Strength values of screws (see page A20)





Belleville spring washers

GN 903

Toggle clamp spindle assemblies

Steel / Stainless Steel, with swivel plastic thrust pad

SPECIFICATION

Thrust pad
Plastic (Polyacetal POM)

- temperature resistant up to 80 °C
- black, matt

Version in Steel ST

Grub screw
Steel

- Tensile strength class 5.8
- blackened

Hexagon nuts ISO 4032
Steel zinc plated, blue passivated

Version in Stainless Steel NI

Grub screw
Stainless Steel AISI 303

Hexagon nuts ISO 4032
Stainless Steel AISI 303

INFORMATION

The ball end of the grub screw can be hit easily into the thrust pad and removed.
The two hexagon nuts are included parts of the order.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)
- Strength values of screws (see page A20)

Clamp mounts

for toggle clamps with forked clamping arm

SPECIFICATION

Steel
zinc plated, blue passivated

INFORMATION

GN 801 clamp mounts have been developed for use with toggle clamps that are designed with a forked clamping arm.
The clamp mounts can be moved along the clamping arm. Once the desired position is reached, you can secure the mount in place with the clamping screw.
The thread d_2 serves to hold the wide variety of toggle clamp spindle assemblies, spring elements and similar devices.
The ideal clamping height can be adjusted without loosening the clamp mount on the forked clamping arm.

Clamp mounts

for toggle clamps with solid clamping arm

SPECIFICATION

Steel
zinc plated, blue passivated

INFORMATION

GN 809 clamp mounts for toggle clamp spindle assemblies have been developed for various toggle clamps in the design version "solid clamping arm".
The clamp mounts can be moved along the clamping arm and be adjusted in height. Once the desired position is reached, fix the mounting in place with the clamping screw.
The thread d_2 serves to hold the wide variety of clamping bolts, spring elements and similar devices.

Pneumatic fastening clamps

Operating principle / types

These pneumatic fastening clamps (patent MISATI) are used for clamping, holding, gripping and positioning of work pieces in jigs and handling systems.

The salient points of these pneumatic fastening clamps are:

- the high clamping force
- the small dimensions
- the reduced air consumption
- the light weight

The working principle of these three types of clamps can be seen from the sketches on the right.

Pistons with diameters of 20, 32, 40 and 50 mm yield a clamping force of 60 Nm up to 475 Nm, which leads to clamping forces being much above those of competitors' clamps.

The pneumatic fastening clamps have been designed and configured to achieve an extended life. Functional tests have proved that even after 20 million cycles they were still serviceable.

Further salient design points are:

- The movement path is designed in such a manner that at the end of the clamping stroke (clamping force FS), irreversible self locking (holding force FH) is achieved.

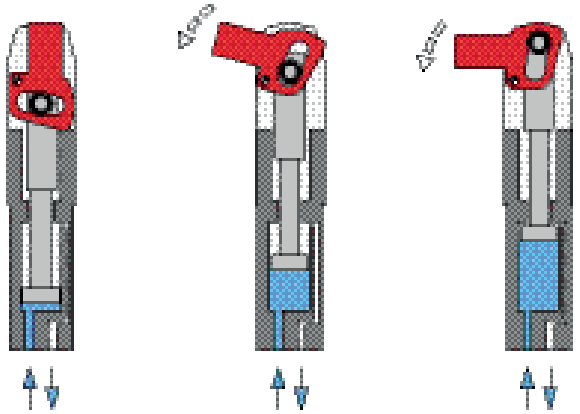
- The forward stroke sequence of the clamping arm is rapid but the ultimate clamping action is slow and as a result pneumatic damping is normally not required. Upon request, however, it can be supplied when big masses are moved.

- The clamping mechanism is fitted with needle bearings which give optimum clamping forces and reduced wear.

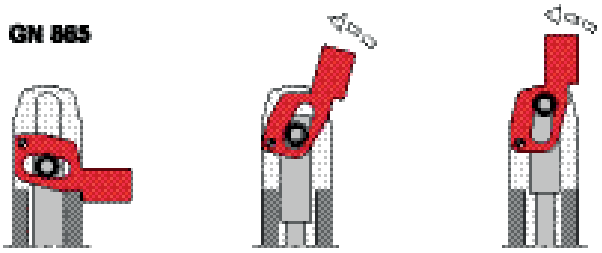
- The steel cylinder with the integrated clamping mechanism are in one unit. This leads to high stability for these small units with an extended range of applications. The placement of the air connection at the bottom end leads also to many other advantages.

- The clamping mechanism of GN 864 (see page 1634) is also shrouded to avoid the ingress of dirt and other objects which could interfere with the proper functioning of the clamps (such as welding operations!)

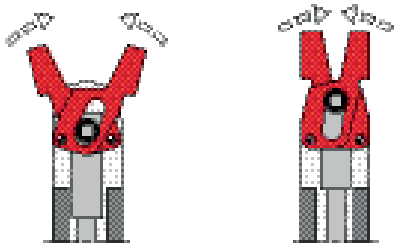
GN 864

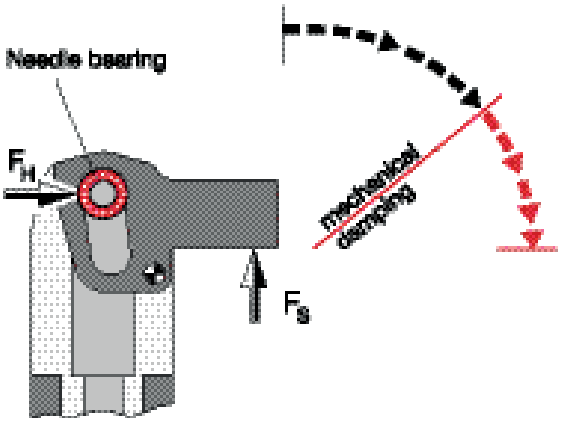


GN 865



GN 866

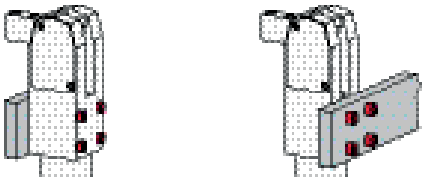




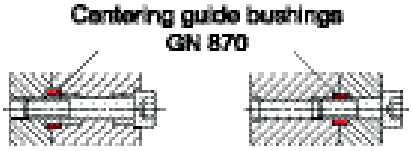
Pneumatic fastening clamps

Mounting methods / accessories

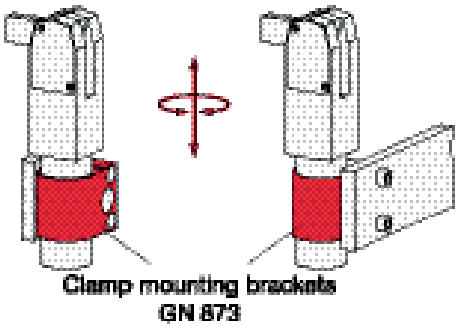
The mounting holes on the main body of the pneumatic fastening clamps have been designed to allow installation direct on the female threaded holes or alternatively with through bolts.



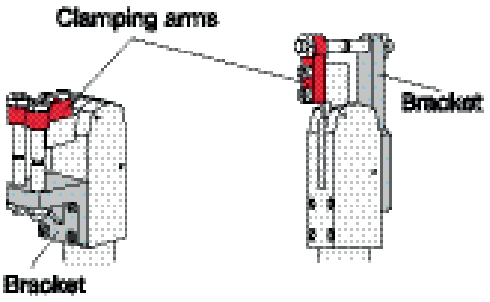
Centering guide bushings present an important function when mounting the pneumatic fastening clamps: they absorb lateral thrust and they ensure a precise alignment.



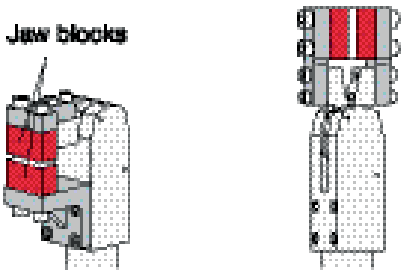
Mounting of the cylinder by a collar clamp increases the numerous ways they can be installed.
Even collar clamps use centering guide bushings for precise positioning.



There is an extensive range of accessories available for pneumatic fastening clamps, such as tool holders (for clamping arms) thrust bolts and clamping jaws. The sketches shown on the right give some idea.

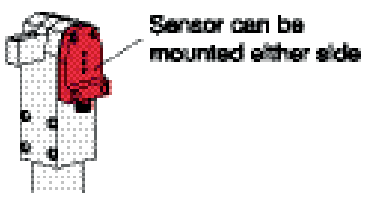


The combination of clamping tools on the clamping arm and brackets represent together a tool set.



For the fixing and precise positioning of clamping arms and jaw blocks, GN 870 (see page 1645) centering guide bushings are also used. The individual data sheets give further information.

All pneumatic fastening clamps can be fitted with proximity switches (inductive sensors) to monitor the end position of the stroke.



Pneumatic fastening clamps

SPECIFICATION

Type

- Type **BL**: Clamping arm horizontal

Steel C45
blackened

max. pressure 10 bar

INFORMATION

The maximum clamping moment of the GN 864 pneumatic fastening clamps is reached once the clamping arm is at the end of its stroke. For this reason the working stroke should be completed as closely as possible to the stroke end.

Single post coupling / Y-coupling accessories

SPECIFICATION

Types

- Type **E**: for one clamping bolt
- Type **Z**: for two clamping bolts

Steel C45
blackened

INFORMATION

GN 867 single post coupling / Y-coupling accessories are suitable for use on clamping arms of the GN 864 (see page 1634) / GN 865 (see page 1635) / GN 866 (see page 1636) pneumatic fastening clamps. Y-coupling accessories for two clamping bolts (Type Z) are preferably used in such applications where absolutely rigid clamping of a sheet metal component is essential. For the same purpose GN 605 (see page 928) ball point screws with serrated ball pads are ideally suited. Cap screws and centering guide bushing accessories are included.

Single post bracket / bracket accessories

for clamping bolts

SPECIFICATION

Types

- Type **E**: for one clamping bolt
- Type **Z**: for two clamping bolts

Steel C45
blackened

INFORMATION

GN 867.1 single post bracket / bracket accessories have been designed for use with GN 864 (see page 1634) pneumatic fastening clamps.
Bracket accessories with two clamping bolts (Type Z) are preferably used for rigid clamping of sheet metal components. For the same purpose GN 605 (see page 928) ball point screws with serrated ball pads are ideally suited.
Cap screws and centering guide bushing accessories are included.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

T-coupling / double post coupling accessories

SPECIFICATION

Types

- Type **R**: Clamping jaws at right angle to clamping arm
- Type **P**: Clamping jaws parallel to clamping arm

Steel C45
blackened

INFORMATION

GN 868 T-coupling / double post coupling accessories are suitable for the clamping arms of the GN 864 (see page 1634)/ GN 865 (see page 1635) / GN 866 (see page 1636) pneumatic fastening clamps. T-coupling accessories are equally precisely positioned on the clamping arm as are the GN 872 (see page 1643) jaw block accessories on the holders themselves.
Cap screws and centering guide bushing accessories are included.

Clamp mounting bracket accessories

for GN 864 / GN 865 / GN 866 pneumatic fastening clamps

SPECIFICATION

Aluminium
black anodized

INFORMATION

GN 873 clamp mounting bracket accessories greatly increase the mounting possibilities and, with that, the field of applications for pneumatic fastening clamps is vastly increased.
The abutting shoulder can be used for precise positioning of the pneumatic fastening clamps thus allowing a problem free exchange of the latter.
The use of the two centering guide bushing accessories ensures an exact and stable installation of the clamp mounting bracket accessories as well as the pneumatic fastening clamps.
Other clamp mounting bracket accessories for the sizes d_1 = 40 (piston Ø 20) and d_1 = 50 (piston Ø 40) are shown under the tube clamp connector range.
Centering guide bushing accessories are included.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)

GN 871

Shim kit accessories

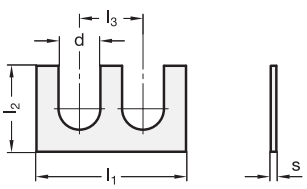
for jaw block accessories

SPECIFICATION

Steel
blackened

INFORMATION

GN 871 shim kit accessories are used to correct any discrepancy in the alignment of the two clamping jaw levels.
This facilitates in a simple way the optimum clamping position of the jaws, i. e. also the optimal clamping force.
The shim kit accessories are only available as a complete set of five of different thicknesses for each size.



Examples of application

Proximity switch

for pneumatic fastening clamps, inductive sensor

SPECIFICATION

Voltage range: 10 to 30 VDC
Switch load: 0 to 100 mA
Voltage drop: ≤ 2 V
Temperature range: 0 °C to 50 °C
Protection class: IP 65
LED-Indication:

- green: operating voltage
- red: switch position closed
- yellow: switch position open

INFORMATION

With these GN 893.1, GN 893.2, GN 893.3 and GN 893.4 proximity switches pneumatic fastening clamps can induce controlled signals whereby the LEDs indicate the operating and switch positions.
The proximity switches can be screwed directly on to the pneumatic fastening clamps. The position of the switches can be on either side.
A plastic intermediate plate and two cap screws M4 are included.

ACCESSORY

Toggle latches

Steel / Stainless Steel

SPECIFICATION

Types

- Type **A**: without spring cotter pin
- Type **B**: with spring cotter pin

Version in Steel ST
zinc plated, blue passivated

Version in Stainless Steel NI
AISI 304

INFORMATION

The outstanding features of GN 8330 toggle latches are superior functionality and design. The integrated spring mechanism holds the locking lever and the clamping hook in the open position and allows effortless operation.
Once the dead center is exceeded, the elasticity of the sheet metal parts will cause the toggle latch to close. In the clamped position, the required drill hole spacing is m_2.
With the stroke w of the clamping hook, the elements to be connected can be pulled together during clamping.
The toggle latch can be secured against opening inadvertently with the so-called spring cotter pin. The spring cotter pin is placed into the d_2 bore hole. Sealing is also possible via d_2.
The retaining force given in the table is a guide value for the potentially static tensile stress load acting on the toggle latch. Depending on the conditions of use (e.g. when exposed to vibrations or shock impact), the retaining force may be impaired.
Screws with low-lying flat head must be used to guarantee the proper function. The drill template also allows the assembly using blank rivets.

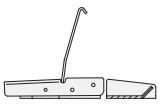
ON REQUEST

- GN 8330.1 spring cotter pin

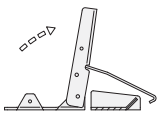
TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

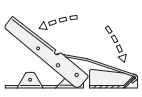
DESCRIPTION OF FUNCTION



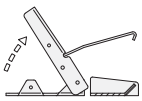
If not operated (i.e. not in the clamping position), both the locking lever and the clamping hook are held in the position shown, kept in place by two torsion springs.



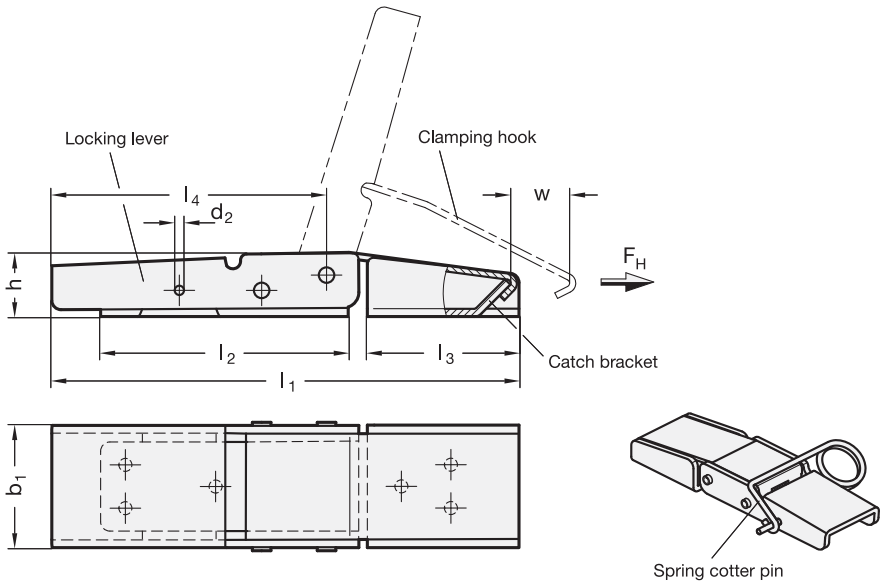
Lifting the clamping lever will swivel the clamping hook into the level of the catch bracket.



For the clamping action, the clamping hook is pressed into the catch bracket and the locking lever is at the same time turned into the starting (retaining) position.



To release, simply lift the locking lever.



Hole pattern for b_1 = 40

Toggle latches

Steel / Stainless Steel

SPECIFICATION

Types

- Type **A**: without safety catch
- Type **S**: with safety catch
- Type **SV**: for safety catch with padlock
- Type **SS**: with key lock

Identification No.

- No. **1**: long Type
- No. **2**: short Type

Version in Steel ST
zinc plated, blue passivated

Version in Stainless Steel NI
only Type A, S and SV

- Parts in sheet metal AISI 304
- Clamping hook / pin AISI 303

INFORMATION

GN 821 toggle latches are used among others for the secure holding of flaps and container lids. The clamps will lock securely over the centre and are thus vibration proof.
The stroke w_1 of the clamping hook can pull the parts to be clamped together by up to 6 mm. The range w_2 can be adjusted on the M6 threaded spindle at the clamping hook.
The types S, SV and SS prevent unwanted release of the toggle latches.
In the standard version the toggle latches of type SS have the same lock and / or the same key.
The load specified in the table are simply guide line values for a nominal static pulling force which the lock can withstand. Depending on the conditions under which these toggle latches are used such as vibration or shock loads, the holding capacity can be adversely affected.
The catch bracket is included.

DESIGNED
FOR ENGINEERING

15 OIL Accessories for hydraulic systems

Plugs

Breather caps

Level indicators

Column level indicators

Plugs

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

PACKING RING
NBR synthetic rubber.

STANDARD EXECUTIONS
- **TN.**: without side hole.
- **TNF.**: with side breather hole.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C.

TECHNICAL DATA
The tightening torque indicated in the table guarantees an optimal tightness, keeping the packing ring in the correct position.

ACCESSORIES ON REQUEST
TN. plugs are suitable for mounting aluminium plates with graphic symbols type MH. (see page 1665).

NBR synthetic rubber.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C

ATEX DIRECTIVE COMPLIANCE
The plugs of the TN-EX series comply with Health and Safety Requirements intended in 94/9/EC ATEX European Directive (explosive atmospheres) for equipments in Group II, category 2GD. Plugs have "k" protection degree and can therefore be mounted in equipments protected by means of "immersion in liquid", without lowering protection degree.
II 2 G D k T5, marked on the TN-EX plugs, represents the identification according to ATEX directive.
II: group of substances for which the product is suitable
2: identification of the category
G: identification of the type of explosive atmosphere (Gases or vapours)
D: identification of the type of explosive atmosphere (Dust)
k: protection degree by means of immersion in liquid
T5: temperature class
Ambient and/or fluid temperature: -30 ÷ +100°C
The declaration of conformity to European Directives of this product is available and it is part of the product itself.

TECHNICAL DATA
The tightening torque indicated in the table guarantees an optimal tightness, keeping the packing ring in the correct position.

Labels with marks and symbols

for oil plugs, aluminium

MATERIAL
Matte anodised aluminium.
Self-adhesive back for sticking to the plain surface of the plug head.

STANDARDIZED GRAPHIC SYMBOLS
- **MH-N**: plain surface, without symbols.
- **MH-C**: with graphic symbol "fill" according to DIN regulations.
- **MH-S**: with graphic symbol "drain" according to DIN regulations.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C.

APPLICATIONS
The plates with graphic symbols for oil plugs are suitable for the application on plugs type TN. (see page 1664), TNR. (see page 1666), TN-EX (see page 1665), TCR. (see page 1667), TCD. (see page 1668), TSD. (see page 1670) and TSR. (see page 1671).

M * = diameter of the seat of the correspondent plug.

Plugs

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

PACKING RING
NBR synthetic rubber O-Ring.
The positioning of the O-Ring in its housing guarantees a high tightening torque.

STANDARD EXECUTIONS
- **TNR.**: without side hole.
- **TNRF.**: with side breather hole.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C.

ACCESSORIES ON REQUEST
TNR. plugs are suitable for mounting aluminium plates with graphic symbols type MH. (see page 1665).

Oil drain plugs

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, red colour similar to RAL 3000, matte finish.

FLAT PACKING RING
NBR synthetic rubber.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C.

GRAPHIC SYMBOL "DRAIN"
According to DIN regulations.

TECHNICAL DATA
The tightening torque indicated in the table guarantees an optimal tightness, keeping the packing ring in the correct position.

ACCESSORIES ON REQUEST
TSD. oil fill plugs are suitable for mounting aluminium plates with graphic symbols type MH. (see page 1665).

Oil drain plugs

Technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, red colour similar to RAL 3000, matte finish.

PACKING RING
NBR synthetic rubber O-Ring.
The positioning of the O-Ring in its housing guarantees a high tightening torque.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C.

GRAPHIC SYMBOL "DRAIN"
According to DIN regulations.

ACCESSORIES ON REQUEST
TSR. oil fill plugs are are suitable for mounting aluminium plates with graphic symbols type MH. (see page 1665).

Sealing ring rubbers NBR (Perbunan)

INFORMATION

Threaded plugs GN 741 are fitted with outside diameter d_1 to suit screw holes with BSP threads to DIN 3852.
The sealing ring is bedded into a undercut groove which prevents it from dropping out and at the same time stops it from being extruded when tightening the cap.

Weight OS

Magnetic plugs

Aluminium

MATERIAL
Black anodised aluminium.
Marked "MAGNETIC" and graphic symbol, laser engraved.

PERMANENT MAGNETIC ELEMENT
(AlNiCo) Aluminium-nickel-cobalt with a high attractive power, to keep metal particles in oil.

STANDARD EXECUTIONS
- **TMB**: NBR synthetic rubber flat packing ring. Max working temperature 100°C.
- **TMB-HT**: FKM synthetic rubber flat packing ring. Max working temperature 180°C.

TECHNICAL DATA
The positioning of the packing ring in its housing guarantees a high tightening torque, therefore the plug can be used even in pressurised reservoirs.

ELESA Original design

TCE.

Plugs

with hexagon socket, technopolymer

MATERIAL
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.

PACKING RING
NBR synthetic rubber.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C.

TECHNICAL DATA
The tightening torque indicated in the table guarantees an optimal tightness, keeping the packing ring in the correct position.

Threaded plugs

Steel, zinc plated

SPECIFICATION

Types

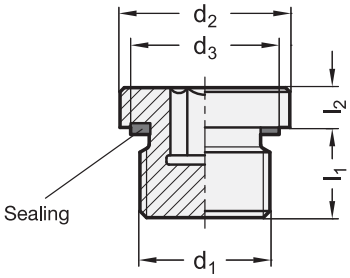
- Type **A**: Sealing ring rubber NBR (Perbunan)
- Type **B**: Sealing ring rubber FPM (Viton®)

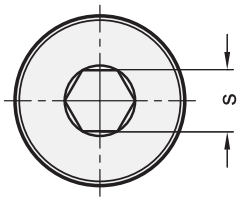
Steel

- Tensile strength class 5.8
- ultrasonically and tensile tested
- zinc plated, nano-passivated (silver / yellowish)

Type **A**
temperature resistant up to **100 °C**
Sealing ring rubber NBR (Perbunan)

Type **B**
temperature resistant up tp **180 °C**
Sealing ring rubber FPM (Viton®)
Identification by not black finish of the seal





INFORMATION

The dimensions of the threaded plugs GN 749 comply with DIN 908 (see page 1681), but deviating from the latter is the elastic sealing ring (rubber). This sealling ring is retained in a radial undercut in the mating face which prevents it from dropping out and in particular it does not extrude when the plug is tightened.
The details relating to the permissible operating pressure are non-binding recommended values and rule out any liability. They constitute no general warranty of quality and condition. The user must determine from case to case whether a product is suitable for the intended use.

Welding sockets

with and without collar

SPECIFICATION

Types

- Type **A**: with chamfer
- Type **B**: with collar

Steel **ST**

- weldable
- turned
- blank

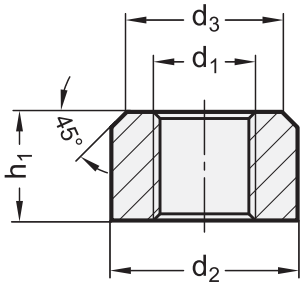
INFORMATION

Welding sockets GN 7490 are used in container construction or in hydraulics for mounting instruments such as oil level sight glasses or locking caps.
The plane surfaces are machined, with the effect that they can be used as sealing surface in connection with a sealing element or compound.
The favourably dimensioned wall thickness prevents deformation or burn-through during welding.
Type B is used if exact positioning through the mounting bore or a low construction height is required.

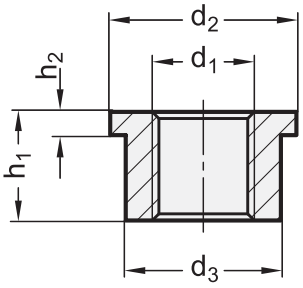
ON REQUEST

- Stainless Steel-Welding sockets
- metric threads

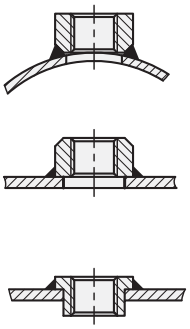
Type **A**



Type **B**



Examples of application



* Complete with type index of the Welding sockets

Version in Steel ST

- ultrasonically and tensile tested
- zinc plated, blue passivated

Version in Stainless Steel AISI 303 NI

Thread coating GPC

Precote 5 (see page A25)

INFORMATION

Threaded plugs DIN 906 are used to close bore holes with cylindrical internal thread.
The tightness depends on the medium, pressure, temperature and material pairing. The design with GPC thread coating provides a higher degree of safety.
The official DIN 906 standard sheet also provides for thread sizes M33x2; M38x1.5; M39x2; M52x1.5; M52x2; M56x2 and M60x2.

Threaded plugs

Resistant up to 100 °C, Aluminium

SPECIFICATION

Identification no.

- No. **1**: without vent hole
- No. **2**: with vent hole

Aluminium

plastic coated
black, RAL 9005, matte finish **SW**

blank **BL**
tumbled

temperature resistant up to **100 °C**
Sealing ring rubber NBR (Perbunan)

INFORMATION

Threaded plugs GN 441 with the external diameter d1 match the screw-in holes for DIN 3852 pipe bolt connections.
The sealing ring is embedded in a radial recess on the plane side, which makes the sealing ring captive and cannot be squeezed out during tightening. The sealing is also relatively soft, enhancing the sealing effect also on uneven surfaces.

ON REQUEST

- Threaded plugs with dipstick

TECHNICAL INFORMATION

GN 442

Threaded plugs

Resistant up to 200 °C, Aluminium

SPECIFICATION

Identification no.

- No. **1**: without vent hole
- No. **2**: with vent hole

Aluminium

plastic coated
black, RAL 9005, matte finish **SW**

blank **BL**
tumbled

temperature resistant up to **200 °C**
Sealing ring rubber FPM (Viton®)

Identification by not black finish of the seal

INFORMATION

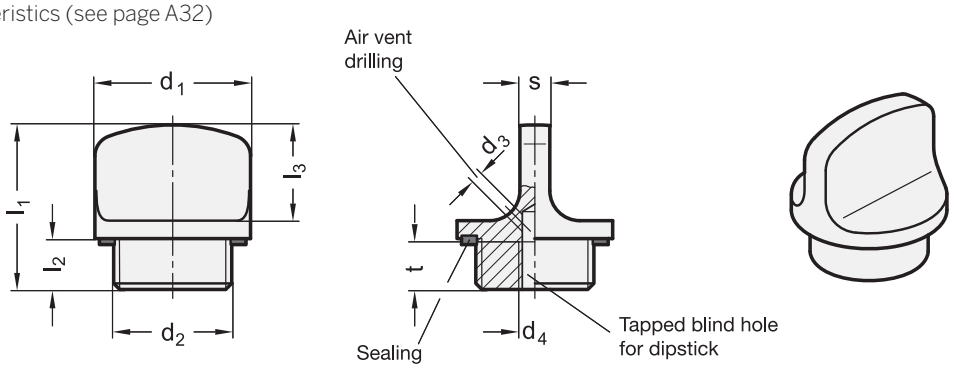
Threaded plugs GN 442 with the external diameter d1 match the screw-in holes for DIN 3852 pipe bolt connections.
The sealing ring is embedded in a radial recess on the plane side, which makes the sealing ring captive and cannot be squeezed out during tightening. The sealing is also relatively soft, enhancing the sealing effect also on uneven surfaces.

ON REQUEST

- Threaded plugs with dipstick

TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)



*Complete with colour index of the Threaded plugs

Oil drain valves

SPECIFICATION

Type
- Type **K**: with plastic protective cap and retaining cable

Valve body
- Steel **ST** zinc plated, blue passivated
- Brass **MS**

Valve plate
- Brass
- O-ring rubber FPM (Viton®)

Sealing disc DIN 7603 A
Copper

Protective cap
Plastic (Polyamide PA)

Retaining cable
Stainless Steel

INFORMATION

Oil drain valves GN 880 may be used for draining non-pressurised oil. As well conditionally as for vacuum drainage.
The flow volume (l/min.) depends on the viscosity of the medium, the filling quantity and the temperature. Guidance values available on request.
Other features are:
- easy and safe handling
- optimum flow rate
- high pressure resistance (up to 100 bar)
- high temperature resistance (-30 °C to +120 °C, short period up to 180 °C)
- 100 % leak-tight tested

TECHNICAL INFORMATION
- Elastomer characteristics (see page A32)

ON REQUEST
- other materials

OPERATION DESCRIPTION

After removing the protective cap secured against loss with a retaining cable, turn in the matching connector pieces GN 880.1 (see page 1690).
When the connector is screwed in, the valve plate will open and the oil will empty through the hose into a pan.
Take off the connector after the oil has drained. The valve plate will be lowered and closes off the drainage outlet.
The container with the oil drain vale is ready for filling again.
Other benefits of the oil drain valves GN 880:
- No risk of burns caused by hot oil
- No dirt caused by uncontrolled oil drainage
- Quick and easy

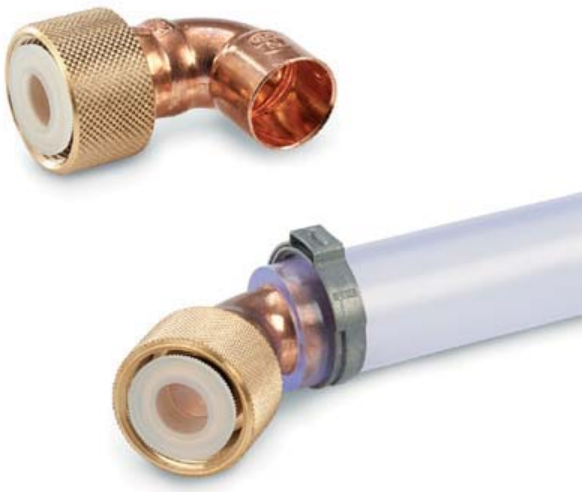
Connector pieces

for oil drain valves GN 880 / with or without drain hose



SPECIFICATION

Types

- Type **A**: Connector straight
- Type **B**: Connector 45°
- Type **C**: Connector 90°

Connecting nut
with hose liner
Brass

L bend 45° / 90 °
Copper

O-Ring
Rubber NBR (Perbunan)

Drain hose
PVC, transparent **T**

Hose clip
Steel, zinc plated

Plug
Plastic, LD-PE

INFORMATION

Connector pieces GN 880.1 are needed when using oil drain valves GN 880 (see page 1688).
Screwing on the connector piece will activate the valve plate of the oil drain valve, allowing the oil to flow through the hose into a pan held ready.
The plug prevents remaining oil from dripping out after discharging.

ON REQUEST

- other hose length
- Drain hose with inside webbing (Nylon)

GN 880.1 | Connector pieces

GN 881

Breather valves

Brass

SPECIFICATION

Valve body
Brass **MS**

Breather cap
Stainless Steel AISI 304 **M**

Gasket
Brass
with silicone-rubber coating (VMQ)

Spring
Stainless Steel AISI 301

Sealing DIN 7603 A
Soft iron 1.0338

temperature resistant from -30 °C to +100 °C

INFORMATION

Once the opening pressure given in the table is exceeded, breather valves GN 881 with gasket will vent into a container and so protect against excessive inside container pressure. A green colour ring marks the opening pressure of 200 mbar.
In its normal state, the gasket closes the container and so prevents dirt or dust getting inside the container.
The above diagram shows the air outlet as a factor of the opening pressure.
The installation position is vertical to the top.
The valves are checked for leak tightness and opening pressure.

ON REQUEST

- other materials
- with other opening pressure 50 mbar (yellow ring)
- with dipstick

GN 882

Breather filters

Brass

SPECIFICATION

Valve body
Brass **MS**

Breather cap
Stainless Steel AISI 304 **M**

Air filter

- Stainless Steel-Wire mesh AISI 304
- Filter category G2-G3
- Mean separation rate (Am approx. 65 - 85 %, based on a particle size > 10 µm)

Sealing DIN 7603 A
Soft iron 1.0338

temperature resistant from -30 °C to +100 °C

INFORMATION

Breather filters GN 882 are used when the air exchange is to be allowed between the inside of the container and the ambient air. The filter function is marked by a blue colour ring.
The filter prevents air-borne particles (e.g. dust) from being carried from the outside to the inside of the container. It also ensures that e.g. oil particles do not escape to the outside.
The above diagram shows the air passage as a factor of the differential pressure.
The recommended installation position is vertical to the top.

ON REQUEST

(for d_1 = M10 x 1:PA6)

Breather cap (Type B)
Stainless Steel AISI 304

temperature resistant from -30 °C to +100 °C

INFORMATION

Once the opening pressure given in the table is exceeded, breather valves GN 883 will vent into a container and so protect against excessive inside container pressure. They also feature highly compact dimensions.
A coding (Type A) or a colour ring (Type B) in yellow (20 - 80 mbar) or green (160 - 240 mbar) indicates the different opening pressure ratings.
The simple function principle (pressure spring / ball) ensures long and trouble-free use of the valve. The installation position is vertical to the top.

Breather filters

Brass

SPECIFICATION

Types

- Type **A**: low design
- Type **B**: high design, with Stainless Steel cap

Valve body
Brass **MS**

Air filter

- Stainless Steel-Wire mesh AISI 304
- Filter category G2-G3
- Mean separation rate (Am approx. 65 - 80 %, based on a particle size > 10 µm)

Sealing DIN 7603 A
Soft iron 1.0338
(at d_1 = M10 x 1: PA6)

Breather (Type B)
Stainless Steel AISI 304

temperature resistant from -30 °C to +100 °C

INFORMATION

The breather filters GN 884 are used when the air exchange is to be allowed between the inside of the container and the ambient air.
The stainless steel wire mesh prevents air-borne particles of a certain size from being carried into the inside of the container and simultaneously ensures that e.g. oil particles do not escape to the outside.
A label with the symbol "BE" (type A) or a blue coloured ring (type B) marks the filter function. The recommended installation position is vertical to the top.

Breather caps

Technopolymer

ELESA Original design

MATERIAL
Polyamide based (PA) technopolymer.
- Cover: RAL 2004 orange, semi-matte finish, marked "OIL".
- Threaded connector: black colour, semi-matte finish.

PACKING RING
NBR synthetic rubber.

STANDARD EXECUTIONS
- **SFN.**: without air filter.
- **SFN+F**: with "tech-foam" air filter in polyurethane foam mesh (polyester base), air filtration 40 µ.
- **SFN.70-BA+F**: with "tech-foam" air filter in polyurethane foam mesh (polyester base), air filtration 40 µ.

Zinc-plated steel sheet bayonet.
Chrome-plated steel safety chain.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C for execution with "tech-foam" air filter.

FEATURES AND APPLICATIONS
SFN. breather caps, owing to their high air flow rate, are particularly suitable for use on hydraulic power packs or tanks subject to rapid changes in liquid volume.

TECHNICAL DATA
Air flow rate for each model can be determined from the graph calculating the difference between the pressure inside and outside the reservoir.

SPECIAL EXECUTIONS ON REQUEST
- Cover, RAL 2004 orange, without "OIL" mark.
- Black cover with or without "OIL" mark.
- Threaded connector also with NPT thread (National Taper pipe Thread - ANSI-ASME B1-20) for the codes marked with # in the table.

SFN-BA+F

Code	Description	D	L	d2	d4	h	⚖
54731	SFN.70-BA+F	70	56	23	39	14	85

Types available on request with NPT thread (National Taper pipe Thread - ANSI-ASME B1-20).

Breather cap

with sealing closure, technopolymer

MATERIAL
- Cover: polyamide based (PA) technopolymer, black colour, semi-matte finish.
- Threaded connector: acetal based technopolymer (POM), black colour, semi-matte finish.

PACKING RINGS
NBR synthetic rubber O-Ring.

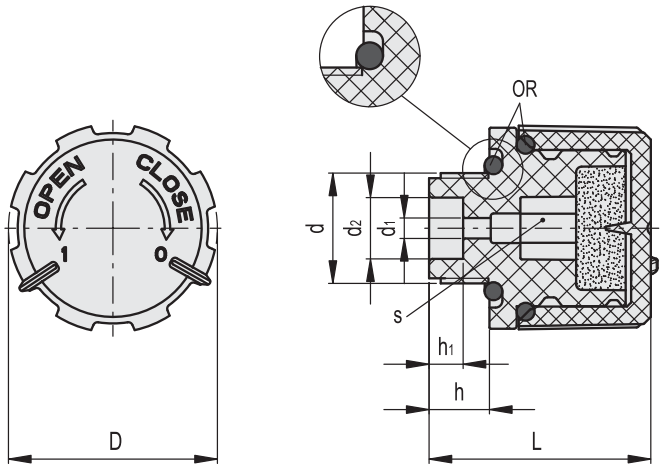
AIR FILTER
Polyurethane foam mesh "tech-foam" (polyester base), air filtration 10 µ.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
80°C.

FEATURES AND APPLICATIONS
The cover of the SFC. breather cap (ELESA Patent) can be positioned in two different ways:
- Breather position: air is let in and out of the reservoir in normal conditions of use.
- Closure position: a packing ring between the cover and the threaded connector flange guarantees a perfect sealing of gas or liquid contained in the reservoir.

SPECIAL EXECUTIONS ON REQUEST
- Air filter in polyurethane foam mesh "tech-foam" (polyester base) with air filtration 40 µ.
- Cover in RAL 2004 orange.

ELESA Original design

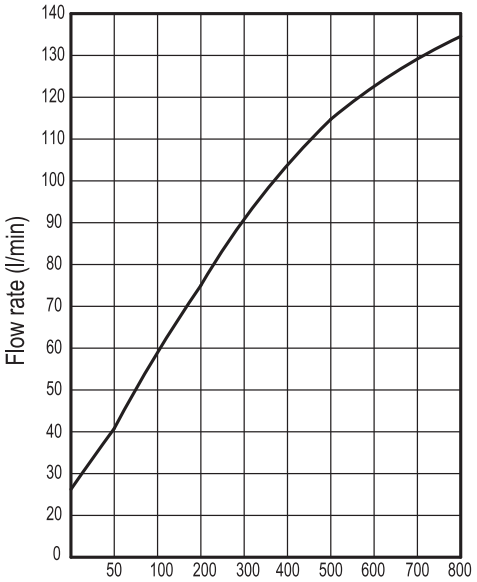


Code	Description	d	D	L	d1	d2	h	h1	s	⚖
52801	SFC.30-3/8+F	G 3/8	30	33	3	9	9	5	8	18

ASSEMBLY INSTRUCTIONS

The components are supplied not assembled.

- Screw the threaded connector by means of a hexagon socket, tightening torque 8 Nm (fig. 1).
- Insert the "tech-foam" filter in its proper upper housing.
- Fit the cover on the threaded connector by properly matching the two different teeth (one large and one tight) inside the cover, with the relevant knurlings on the upper part of the threaded connector (fig. 2).
- By turning the cover clockwise of a few degrees the breather position is reached: the index on the cover marked with 1 is in line with the index of the threaded connector (fig. 3).
- By further turning the cover clockwise following the CLOSE arrow, the closure position is reached: the index on the cover marked with 0 is in line with the index of the threaded connector (fig. 4).
- To reach from the closure position to the breather one just turn the cover anticlockwise following the OPEN arrow until the click.
- By further turning the cover anticlockwise following the OPEN arrow, it is possible to remove the cover from the threaded connector, thus allowing the operator to clean the two components or to substitute or clean the "tech-foam" filter (fig. 5).



(difference between the pressure inside and outside the reservoir)

Breather caps

with splash guard, technopolymer

ELESA Original design

MATERIAL
Polyamide based (PA) technopolymer.
- Cover: RAL 2004 orange, semi-matte finish, marked "OIL".
- Threaded connector: black colour, semi-matte finish.

PACKING RING
NBR synthetic rubber.

SPLASH GUARD
Technopolymer.

STANDARD EXECUTIONS
- **SFP.**: without air filter (black splash guard).
- **SFP+F**: with "tech-foam" air filter in polyurethane foam mesh (polyester base), air filtration 40 µ (grey splash guard) or with "tech-fil" air filter in zinc-plated steel wire (orange splash guard).
- **SFP.70-BA+F**: with "tech-foam" air filter in polyurethane foam mesh (polyester base), air filtration 40 µ (grey splash guard).

Zinc-plated steel sheet bayonet.
Chrome-plated steel safety chain.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C.

FEATURES AND APPLICATIONS
SFP. breather caps come complete with splash guard device (ELESA original design) that prevents oil loss and are particularly suitable for use where oil is violently agitated and could be splashed against breather cap.

TECHNICAL DATA
Air flow rate for each model can be determined from the graph calculating the difference between the pressure inside and outside the reservoir.

SPECIAL EXECUTIONS ON REQUEST
- Cover, RAL 2004 orange, without "OIL" mark.
- Black cover with or without "OIL" mark.
- Threaded connector also with NPT thread (National Taper pipe Thread - ANSI-ASME B1-20) for the codes marked with # in the table.

Breather caps

with splash guard and flat dipstick, technopolymer

MATERIAL
Polyamide based (PA) technopolymer.
- Cover: RAL 2004 orange, semi-matte finish, marked "OIL".
- Threaded connector: black, semi-matte finish.

PACKING RING
NBR synthetic rubber.

FLAT DIPSTICK
Flat section phosphatised steel. On request and for sufficient quantities dipstick can be supplied in different lengths and/or complete with MAX-MIN level lines.

SPLASH GUARD
Technopolymer.

STANDARD EXECUTIONS
- **SFP+a**: without air filter (black splash guard).
- **SFP+F+a**: D = 31, 42 and 57 with "tech-fil" air filter in zinc-plated steel wire (orange splash guard); D = 70 with "tech-foam" air filter in polyurethane foam mesh (polyester base), air filtration 40 µ (grey splash guard).
- **SFP.70-BA+F+a**: with "tech-foam" air filter in polyurethane foam mesh (polyester base), air filtration 40 µ (grey splash guard).

Zinc-plated steel sheet bayonet.
Chrome-plated steel safety chain.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C.

FEATURES AND APPLICATIONS
SFP+a breather caps come complete with splash guard device (ELESA originale design) that prevents oil loss and are particularly suitable for use where oil is violently agitated and could be splashed against the breather cap.

TECHNICAL DATA
Air flow rate for each model can be determined from the graph calculating the difference between the pressure inside and outside the reservoir.

SPECIAL EXECUTIONS ON REQUEST
- Cover, RAL 2004 orange, without "OIL" mark.
- Black cover with or without "OIL" mark.

Breather caps

with splash guard, technopolymer

MATERIAL
Polyamide based (PA) technopolymer.
- Cover: RAL 2004 orange, semi-matte finish, marked "OIL".
- Threaded connector: black colour, semi-matte finish.

PACKING RING
NBR synthetic rubber.

SPLASH GUARD
Technopolymer.

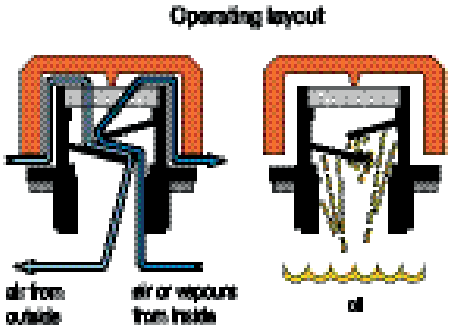
STANDARD EXECUTIONS
- **SFP-EX**: without air filter (black splash guard).
- **SFP+F-EX**: with "tech-foam" air filter in polyurethane foam mesh (polyester base), air filtration 40 µ (grey splash guard).

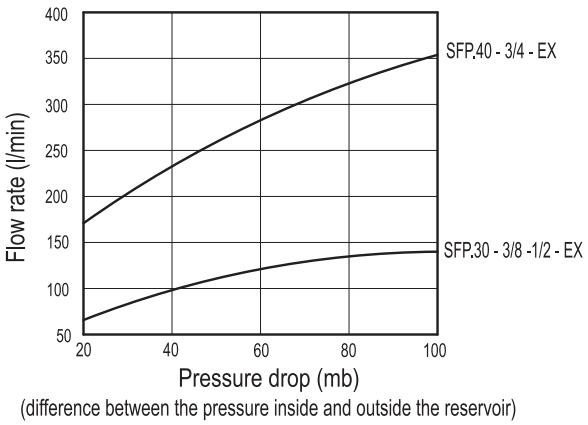
ATEX DIRECTIVE COMPLIANCE
The breather caps of the SFP-EX series comply with Health and Safety Requirements intended in 94/9/EC ATEX European Directive (explosive atmospheres) for equipments in Group II, category 2GD.
II 2 G D IIB T6, marked on the SFP-EX breather caps, represents the identification according to ATEX directive.
II: group of substances for which the product is suitable
2: identification of the category
G: identification of the type of explosive atmosphere (Gases or vapours)
D: identification of the type of explosive atmosphere (Dust)
IIB: group of explosive gases
T6: temperature class
Ambient and/or fluid temperature: -30 ÷ +80°C
The declaration of conformity to European Directives of this product is available and it is part of the product itself.

FEATURES AND APPLICATIONS
SFP-EX breather caps come complete with splash guard device (ELESA original design) that prevents oil loss and are particularly suitable for use where oil is violently agitated and could be splashed against breather cap.

TECHNICAL DATA
Air flow rate for each model can be determined from the graph calculating the difference between the pressure inside and outside the reservoir.

ELESA Original design





(difference between the pressure inside and outside the reservoir)

Breather caps

with splash guard and flat dipstick, technopolymer

MATERIAL
Polyamide based (PA) technopolymer.
- Cover: RAL 2004 orange, semi-matte finish, marked "OIL".
- Threaded connector: black colour, semi-matte finish.

PACKING RING
NBR synthetic rubber.

FLAT DIPSTICK
Flat section phosphatised steel.
On request and for sufficient quantities dipstick can be supplied in different lengths and/or complete with MAX-MIN level lines.

SPLASH GUARD
Technopolymer.

ATEX DIRECTIVE COMPLIANCE
The breather caps of the SFP+a-EX series comply with Health and Safety Requirements intended in 94/9/EC ATEX European Directive (explosive atmospheres) for equipments in Group II, category 2GD.

Breather caps with vacuum breaker valve

Technopolymer

ELESA Original design

MATERIAL

Polypropylene based (PP) technopolymer.
- Cover: red colour (TVD-EPDM), green (TVD-FKM).

Graphic symbol "valve" tampoprinted in black colour.
- Avoid contact with solvents, alcohol or detergents containing alcohol to preserve tampoprinted graphic symbol.

Threaded connector: black colour.

STANDARD EXECUTIONS

- **TVD-FKM**: flat packing ring and FKM membrane gasket, hardness 70 Shore A.
- **TVD-EPDM**: flat packing ring and EPDM membrane gasket, hardness 70 Shore A.

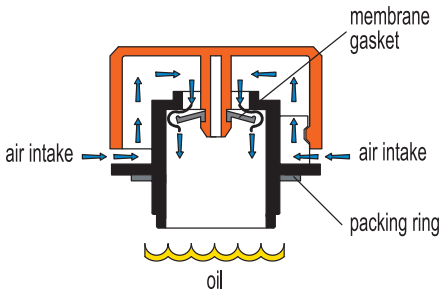
MAXIMUM CONTINUOUS WORKING TEMPERATURE

50°C.

FEATURES AND APPLICATIONS

TVD. breather caps with vacuum breaker valve are suitable for reservoirs and tanks for liquid transport.
The membrane retaining system allows a quick emptying out of the reservoir by letting in big quantities of air through the cap. Thus avoiding the vacuum inside the reservoir, slowing down the liquid exit.
The pre-set pressure of the membrane gasket stops any liquid loss when the reservoir is shaken (for example during transportation).
The liquid pressure on the gasket guarantees a perfect seal of the cap, for example in case of overturning of the reservoir.

Operating layout



The membrane gasket warps and lets air inside the reservoir due to the effect of the vacuum which is created by the liquid discharge.

Valve breather caps

Technopolymer

MATERIAL
Polyamide based (PA) technopolymer.
- Cover: RAL 2004 orange, semi-matte finish, with graphic symbol "valve".
- Threaded connector: black colour, semi-matte finish.

PACKING RING
NBR synthetic rubber.

SEALING DISK
Technopolymer with NBR synthetic rubber O-ring.

SPRING
Stainless steel.

STANDARD EXECUTIONS
- **SFV-10 mb**: valve (sealing disk) opens when pressure exceeds 0.010 bar (set at 10 mb).
- **SFV-100 mb**: valve (sealing disk) opens when pressure exceeds 0.100 bar (set at 100 mb).

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C.

FEATURES AND APPLICATIONS
SFV. valve breather caps are particularly suitable for all those applications (speed reducers, variators or compressors) when the internal air pressure must not exceed a certain value (10 or 100 mb). In these cases, the safety valve of the cap allows the expulsion of the exceeding air in the reservoir, thus re-establishing the pressure values for which the valve is set.
Sealing disc (closed in normal pressure conditions) prevents dust from getting in and oil-losses.

SPECIAL EXECUTIONS ON REQUEST
Black cover.

Pressurised breather caps

with double valve, technopolymer

MATERIAL
Polyamide based (PA) technopolymer.
- Cover: RAL 2004 orange, semi-matte finish, with graphic symbol "valve".
- Threaded connector: black colour, semi-matte finish.

PACKING RING
NBR synthetic rubber.

OVERPRESSURE VALVE
Technopolymer with NBR synthetic rubber O-ring and stainless steel spring.
Set at around 0.350 bar (on request 0.700 bar).

SUCTION VALVE
Technopolymer sealing disk with NBR synthetic rubber O-ring and stainless steel spring.
Set at around 0.030 bar.

RING-SHAPED AIR FILTER
"Tech-foam" polyurethane foam mesh (polyester base), air filtration 40 µ.

FLAT DIPSTICK
Flat section phosphatised steel.
On request and for sufficient quantities dipstick can be supplied in different lengths and/or complete with MAX-MIN level lines.

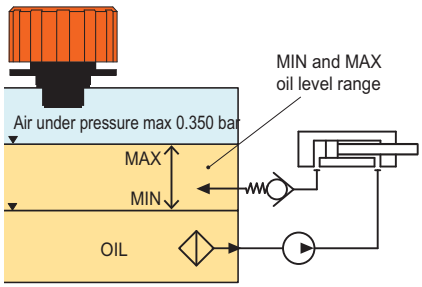
STANDARD EXECUTIONS
- **SFW+F**: without flat dipstick.
- **SFW-BA+F**: with zinc-plated steel sheet bayonet, without flat dipstick. Chrome-plated steel safety chain.
- **SFW+F+a**: with flat dipstick.
- **SFW-BA+F+a**: with zinc-plated steel sheet bayonet and flat dipstick. Chrome-plated steel safety chain.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C.

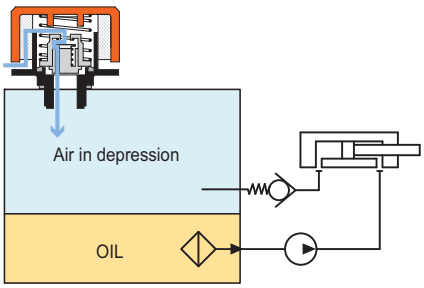
SPECIAL EXECUTIONS ON REQUEST
- Black cover.
- Threaded connector also with NPT thread (National Taper pipe Thread - ANSI-ASME B1-20) for the codes marked with # in the table.

ELESA Original design

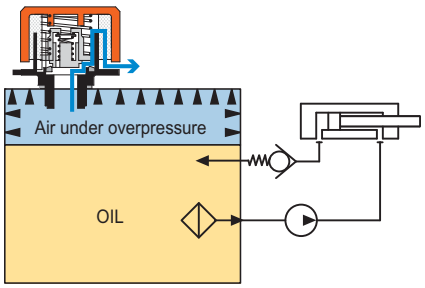
SFW. pressurised breather cap functioning in a hydraulic circuit



Normal working conditions



When in the reservoir a depression around 0.030 bar is produced, a flux of air entering the reservoir through the suction valve takes place.



When in the reservoir an over pressure exceeding 0.350 (or 0.700) bar is produced, a flux of air is discharged through the safety valve.

SFW. Pressurised breather caps

FEATURES

The use of SFW. pressurised breather caps which create a pressure plenum chamber right above the oil level within tested limit conditions, in order to avoid any reservoir deformation, offers the following advantages:

- reduces reservoir air volume intake keeping clean oil and filter
- improves suction pump action during working conditions reducing cavitation phenomenon
- prevents fluid leakage when the system is part of a mobile unit
- reduces foam in fluid.

TECHNICAL DATA

Air flow rate for each model can be determined from the graph calculating the difference between the pressure inside and outside the reservoir.

RoHS PA POM +100° -30°

Pressurised breather caps

with double valve and vandal-proof device, technopolymer

ELESA Original design

MATERIAL
- Cover: polyamide based (PA) technopolymer, black colour, matte finish. Graphic symbol "double valve".
- Threaded connector: acetal based technopolymer (POM), black colour, matte finish.

PACKING RING
NBR synthetic rubber.

OVERPRESSURE VALVE
Technopolymer with NBR synthetic rubber O-ring and stainless steel spring.
Set at around 0.350 bar (on request 0.700 bar).

SUCTION VALVE
Technopolymer sealing disk with NBR synthetic rubber O-ring and stainless steel spring.
Set at around 0.030 bar.

RING-SHAPED AIR FILTER
"Tech-foam" polyurethane foam mesh (polyester base), air filtration 40 µ.

KEY
Acetal resin-based (POM) technopolymer, red colour, with stainless steel anti-intrusion-profile insert. Folding. On request it can be supplied in black colour too.

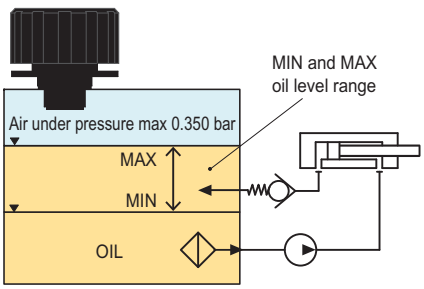
MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C.

"VANDAL-PROOF" SAFETY DEVICE (ELESA PATENT)
It is especially designed to prevent the cap from being unscrewed without permission. It is provided with a "controlled-torque" mechanism which guarantees the best seal of the packing ring.

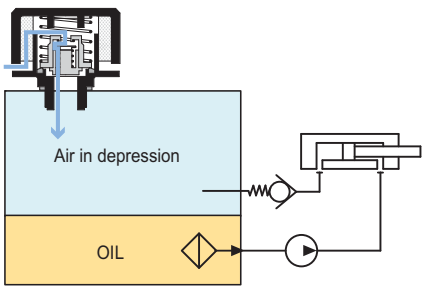
SPECIAL EXECUTIONS ON REQUEST
Flat dipstick, flat section phosphatised steel.

APPLICATIONS
SFW-VP pressurised breather caps are suitable for material handling equipment, machines for the agriculture sector and in general for those machines which remain unattended.
Thanks to its small dimensions, the key can be kept together with others (e.g. starting key of the engine).

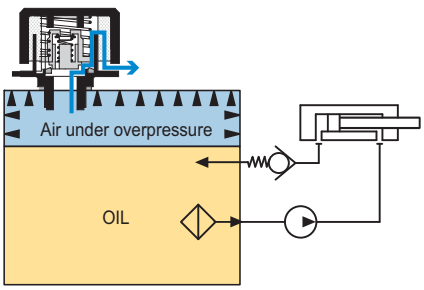
SFW.VP pressurised breather cap functioning in a hydraulic circuit



Normal working conditions



When in the reservoir a depression around 0.030 bar is produced, a flux of air entering the reservoir through the suction valve takes place.



When in the reservoir an over pressure exceeding 0.350 (or 0.700) bar is produced, a flux of air is discharged through the safety valve.

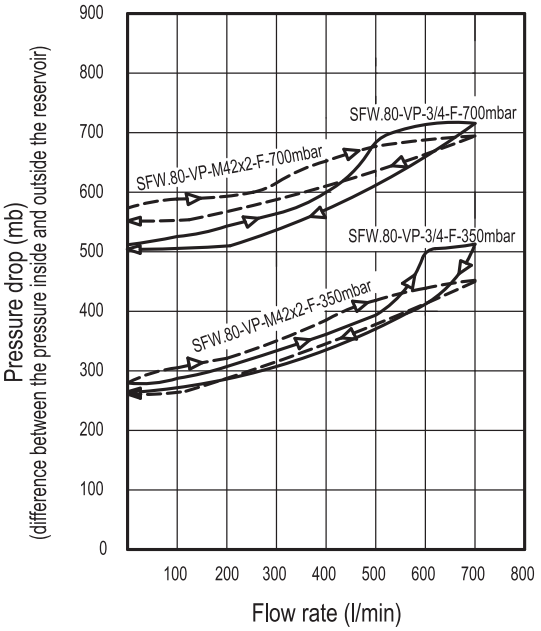
SFW-VP | Pressurised breather caps

FEATURES

The use of SFW-VP pressurised breather cap which create a pressure plenum chamber right above the oil level within tested limit conditions, in order to avoid any reservoir deformation, offers also other advantages (see features of the breather caps type SFW. on page 1712).

TECHNICAL DATA

Air flow rate for each model can be determined from the graph calculating the difference between the pressure inside and outside the reservoir.



"VANDAL-PROOF" SAFETY DEVICE FUNCTIONING

- Cap screwing.

Take out the key and screw the cap clockwise until the friction-click controlled torque mechanism is engaged so that to guarantee the best sealing of the packing ring. The maximum torque is reached at the first mechanism release (click).
After that, the cap can neither be screwed (to protect the packing ring) nor unscrewed (to protect the cap from any tampering attempt).
WARNING: during screwing the key must not be inserted.

- Cap unscrewing.

Turn the cap clockwise until one of the two resistance points is reached. Only at one of these two positions the key, which couples the cover to the threaded connector, can be competely inserted and the cap can be unscrewed.

Pressurised breather caps

with double valve and threaded connector, steel

MATERIAL
- Cover: steel sheet, with chrome plating superficial treatment.
- Flange: zinc-plated steel sheet.
- Threaded connector: zinc-plated steel.

PACKING RING
NBR synthetic rubber.

OVERPRESSURE VALVE (ONLY FOR SMW.)
Technopolymer with NBR synthetic rubber O-ring and stainless steel spring.
Set at around 0.350 bar (0.700 bar on request).

SUCTION VALVE (ONLY FOR SMW.)
Technopolymer sealing disk with NBR synthetic rubber O-ring and stainless steel spring.
Set at around 0.030 bar.

RING-SHAPED AIR FILTER
Tech-foam 40 µ.

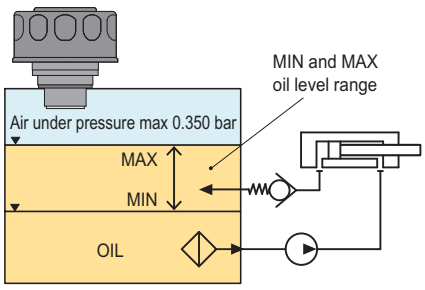
FILTER SETTING SPRING (ONLY FOR SMN.)
Zinc-plated steel.

STANDARD EXECUTIONS
- **SMN.**: breather cap.
- **SMW.**: double-valve breather cap.

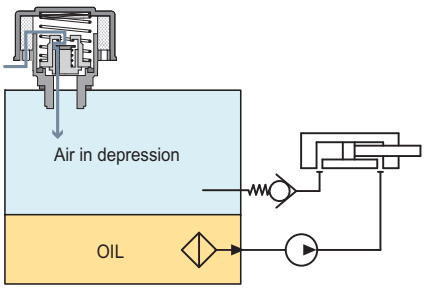
MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C.

SPECIAL EXECUTIONS ON REQUEST
With dipstick for fluid level indication (only for SMW.).

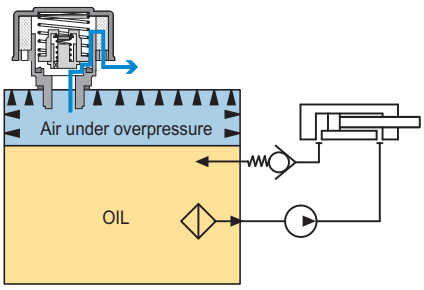
SMW. pressurised breather cap functioning in a hydraulic circuit



Normal working conditions



When in the reservoir a depression around 0.030 bar is produced, a flux of air entering the reservoir through the suction valve takes place.



When in the reservoir an over pressure exceeding 0.350 (or 0.700) bar is produced, a flux of air is discharged through the safety valve.

SMN. SMW. | Pressurised breather caps

FEATURES AND APPLICATIONS

Double-valve breather cap SMW. creates a pressure plenum chamber right above the oil level within given limit conditions in order to avoid any reservoir deformation.
Advantages:
- it reduces reservoir air volume intake keeping clean fluid and filter;
- it improves suction pump action under working conditions reducing cavitation phenomenon;
- it prevents fluid leakage when the system is part of a mobile unit;
- it reduces foam in fluid.

TECHNICAL DATA

Air flow rate for the different executions of breather caps can be obtained from the diagram on the basis of the difference of air pressure inside and outside the reservoir.

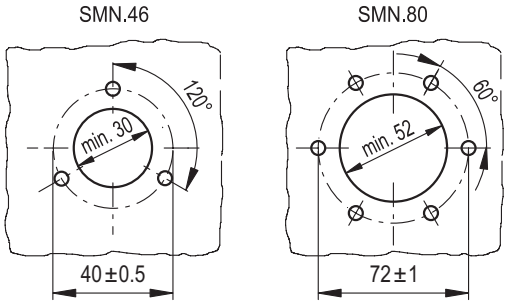
100°C.

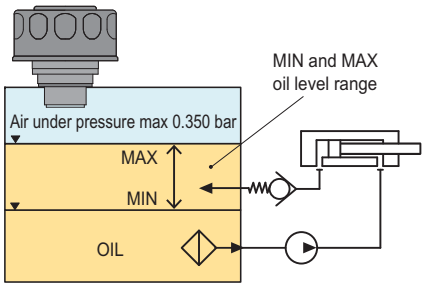
SPECIAL EXECUTIONS ON REQUEST
With dipstick for fluid level indication (only for SMW-BA).

MOUNTING
- SMN.46: by means of three glossy zinc-plated steel screws with screwdriver slot head M5x12, supplied.
- SMN.80 SMW.80: by means of six glossy zinc-plated steel screws with screwdriver slot head M5x12, supplied.

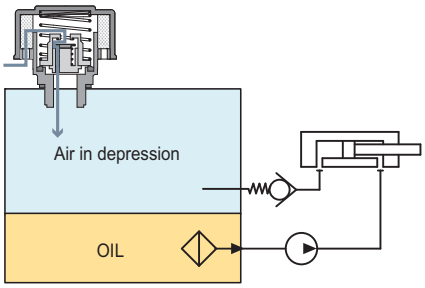
Drilling templates



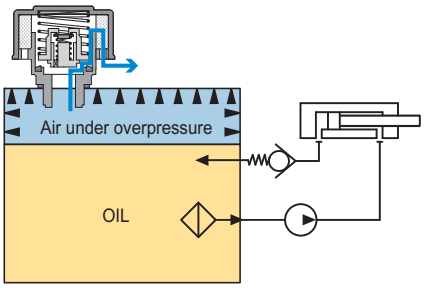
SMW-BA pressurised breather cap functioning in a hydraulic circuit



Normal working conditions



When in the reservoir a depression around 0.030 bar is produced, a flux of air entering the reservoir through the suction valve takes place.



When in the reservoir an over pressure exceeding 0.350 (or 0.700) bar is produced, a flux of air is discharged through the safety valve.

SMN-BA SMW-BA | Pressurised breather caps

FEATURES AND APPLICATIONS

Double-valve breather caps SMW.BA with bayonet assembly creates a pressure plenum chamber right above the oil level within given limit conditions in order to avoid any reservoir deformation.
Advantages:
- it reduces reservoir air volume intake keeping clean fluid and filter;
- it improves suction pump action under working conditions reducing cavitation phenomenon;
- it prevents fluid leakage when the system is part of a mobile unit;
- it reduces foam in fluid.

TECHNICAL DATA

Air flow rate for the different executions of breather caps can be obtained from the diagram on the basis of the difference of air pressure inside and outside the reservoir. Tests carried out without filtration basket.

Flange

for threaded cap, technopolymer

MATERIAL
- Flange: glass-fibre reinforced polyamide based (PA) technopolymer with threaded connector.
- Basket: polypropylene based (PP) technopolymer.

COLOUR
Black, matte finish.

PACKING RINGS
Cork impregnated MGS based rubber.

MOUNTING
By means of six zinc-plated steel self-tapping screws TC-N10 (Ø 4.8x19) UNI 6951-DIN 7971, supplied.

NOTE
The breather cap to be coupled to the flange is not included in the supply and has to be ordered sepatately.
Depending on the customer's requirements, can be used breather caps type SFN. (see page 1698), SFP. (see page 1702), SFW. (see page 1712).

SPECIAL EXECUTIONS ON REQUEST
Threaded flange without basket (FRF).

Side mount

for threaded cap, technopolymer

MATERIAL

- Mount: polyamide based (PA) technopolymer with NBR synthetic rubber packing ring.
- Flange: glass-fibre reinforced polyamide based (PA) technopolymer, threaded connector with flat gasket in cork impregnated MGS based rubber
- Basket: polypropylene based (PP) technopolymer.

COLOUR

Black, matte finish.

MOUNTING

Flange and basket are fitted to the mount by means of six zinc-plated steel self-tapping screws TC-N10 (Ø 4.8x19) UNI 6951-DIN 7971, supplied.
The mount is fitted to the reservoir by means of seven M6 screws and relative washers (not supplied).
Maximum recommended tightening torque: 8 Nm.

NOTE

The breather cap to be coupled to the flange is not included in the supply and has to be ordered sepatately.
Depending on the customer's requirements, can be used breather caps type SFN. (see page 1698),SFP. (see page 1702),SFW. (see page 1712).

ATEX DIRECTIVE COMPLIANCE
The level indicators of the HGFT-EX series comply with Health and Safety Requirements intended in 94/9/EC ATEX European Directive (explosive atmospheres) for equipments in Group II, category 2GD.
Level indicators have "kX" protection degree and can therefore be mounted on equipment protected by means of "immersion in liquid", without lowering protection degree.
II 2 G D k T6 X, marked on the HGFT-EX level indicators, represents the identification according to ATEX directive.
II: group of substances for which the product is suitable
2: identification of the category
G: identification of the type of explosive atmosphere (Gases or vapours)
D: identification of the type of explosive atmosphere (Dust)
kX: protection degree by means of immersion in liquid
IIB: explosive gases group (only for HGFT.16)
T6: temperature class
Ambient and/or fluid temperature: -30 to +80°C
The declaration of conformity to European Directives of this product is available and it is part of the product itself.

ELESA Original design

NOTE
For use with other fluids with special additives, please contact ELESA Sales Department.

Oil level sight glasses

Aluminum / natural glass, up to 100°C

SPECIFICATION

Types

- Type **A**: with contrast screen, blank
- Type **AS**: with contrast screen, black anodized
- Type **B**: without contrast screen, blank
- Type **BS**: without contrast screen, black anodized

Body
Aluminium

- Type A and B: fine turned, blank
- Type AS and BS: fine turned, black anodized

Contrast screen
Technopolymer (Polysulfon)

- temperature resistant up to **100 °C**
- Sight glass Float-glass
- Sealing ring rubber NBR (Perbunan)

INFORMATION

Oil level sight glasses GN 743 offer genuine glass of high stability and scratch proof. The sealing is achieved with an O-ring on the **periphery** and not on the face edge of the glass. Leak tightness is therefore not affected by axial pressures.
The outside diameter of these oil level sight glasses with recessed hexagon is chosen to match mounting holes for tube connections according to DIN 3852.
The seal is housed in a groove and it can therefore not be lost. In addition, this groove prevents the seal from being extruded when the sight glass is tightened.
Oil level sight glasses GN 743 can be used on pressurised oil tanks. Tests regarding maximum pressure are available on request.
Assembly instruction:
For mounting on walls of less than 4 mm thickness please use a fixing nut GH. (see page 1743).

- RoHS compliant (only types AS and BS)

ACCESSORY

- Fixing nut GH. (see page 1743)

ON REQUEST

- EPDM seal

Weight type A

GN 743.5

Stainless Steel-
Oil level sight glasses

Natural glass, up to 180 °C

SPECIFICATION

Types

- Type **A**: with contrast screen
- Type **B**: without contrast screen

Body
Stainless Steel AISI 303

Contrast screen (Type A)
Technopolymer (Polysulfan)

Circlip (Type B)
Stainless Steel AISI 301

- temperature resistant up to **180 °C**
- Sight glass ESG-glass
- Sealing ring rubber FPM (Viton®)

Identification by not black finish of the sealing ring

INFORMATION

Stainless Steel-Oil level sight glasses GN 743.5 offer genuine glass of high stability and scratch proof. The sealing is achieved with an O-ring on the periphery and not on the face edge of the glass. Leak tightness is therefore not affected by axial pressures.
The outside diameter of these oil level sight glasses with recessed hexagon is chosen to match mounting holes for tube connections according to DIN 3852.
The seal is housed in a groove and it can therefore not be lost. In addition, this groove prevents the seal from being extruded when the sight glass is tightened.
Stainless Steel-Oil level sight glasses GN 743.5 can be used on pressurised oil tanks. Tests regarding maximum pressure are available on request.

ON REQUEST

- EPDM seal

TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)
- Stainless Steel characteristics (see page A26)

Weight type A

ATEX-Sight glasses

Aluminium / Natural glass

SPECIFICATION

Body
Aluminium
Surface fine turned

Sight glass
ESG-glass

Sealing ring
rubber FPM (Viton®)

Circlip
Stainless Steel AISI 301

Temperature range:
-20 °C up to +150 °C

INFORMATION

ATEX-Sight glasses GN 743.6 are suitable for use in an explosion risk environment. They comply with the guidelines 94/9/EG. Detailed documentation is available and forms part of an order for this product.
A detailed operating instruction is included.
In addition, the body is provided with an ATEX-label.
Further salient points of the oil level sight glasses GN 743.6 are:
Genuine glass of high stability and scratch proof. The sealing is achieved with an O-ring on the **periphery** and not on the face edge of the glass. Leak tightness is therefore not affected by axial pressures.
The sealing ring is embedded in a radial groove and cannot drop out, nor can it be extruded when tightening torque is applied.
Sight glasses GN 743.6 can be used on pressurised oil tanks. Tests regarding maximum pressure are available on request.
Assembly instruction:
For mounting on walls of less than 4 mm thickness please use a fixing nut GH. (see page 1743).

ACCESSORY

- Fixing nut GH. (see page 1743)

ON REQUEST

- EPDM seal

TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)
- Stainless Steel characteristics (see page A26)

GN 743.7

Oil level sight glasses

Brass / natural glass, resistant up to 100 °C

SPECIFICATION

Types

- Type **A**: with contrast screen
- Type **B**: without contrast screen

Body
Brass
CuZn40Pb2

Contrast screen
Technopolymer (Polysulfon)

- temperature resistant up to **100 °C**
- Sight glass Float-glass
- O-Ring rubber NBR (Perbunan)

INFORMATION

The conical thread of the oil level sight glasses GN 743.7 makes a metallic seal possible. When tightening the conical male thread R it blocks itself with the appropriate cylindrical female thread Rp.
With the datum plane a the R-male thread has the same thread diameter as the Rp-female thread, so that it can be screwed in by hand. The strong tightening by means of a tool increases the length of engagement and seals the screw connection. Additionally a sealant (hemp or teflon band) is usually used. The R-thread is „roughened", so that the sealant does not shift when screwing in.

ON REQUEST

- EPDM O-rings

HGFT-PR

Oil level indicators

with prismatic window, technopolymer

MATERIAL
Polyamide based (PA) technopolymer, black colour, glossy finish.

PRISMATIC WINDOW
Transparent polyamide based (PA-T/AR) technopolymer. The window consists of a continuous series of prisms which provide a clear and immediate reading of the level of the oil contained in the reservoir.

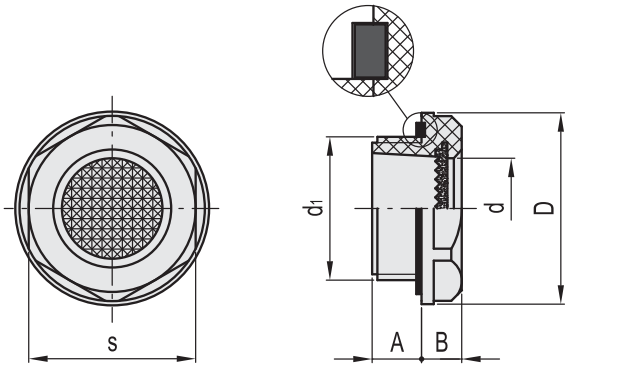
PACKING RING
NBR synthetic rubber.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C at 3 bar pressure.

NOTE
For use with other fluids with special additives, please contact ELESA Sales Department.

ACCESSORIES ON REQUEST
Brass nut type GH. (see page 1743) for fitting to reservoirs with wall thickness smaller than 5 mm.

ELESA Original design



Code	Description	d1	A	B	D	d	s	Tightening torque [Nm]

GN 7403

Breather strainers

with Stainless Steel mesh

SPECIFICATION

Body

- Aluminium **AL**
- Stainless Steel AISI 303 **NI**

Strainer
Stainless Steel mesh
AISI 304

Strainer bezel
Plastic Polyamide (PA)

- glass fibre reinforced
- temperature resistant up to 100 °C

Sealing / O-Ring
Rubber NBR (Perbunan ®)

INFORMATION

Breather strainers GN 7403 are used in enclosure and device construction. Inserted into the wall of the enclosure, they ensure pressure equilibrium between the inside of the enclosure and the outside.
Any dirt and dust particles carried by the medium (usually gas) are prevented from exiting depending on the mesh size. This protects the insides of sensitive devices and machinery parts from dirt and pollution and also protects the environment from any exiting dust.
The outside diameter of the enclosure with the recessed hexagon matches the bolt mounting holes for DIN 3852 threaded pipe connectors.
The sealing ring is embedded in a radial and plane-sided recess which makes the seal captive and prevents it from being squeezed out during tightening.
Assembly instruction:
For mounting on walls of less than 4 mm thickness, please use mounting nut GH. (see page 1743).

ACCESSORY

- Mounting nut GH. (see page 1743)

ON REQUEST

- Body in brass
- Other mesh size
- Other material for the strainer

TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)
- Plastic characteristics (see page A2)

- temperature resistant up to 100 °C

O-ring
NBR (Perbunan)

INFORMATION

GN 7405 Stainless Steel-Strainer fittings are suited for assembly into piping systems as upstream or downstream protection devices. Depending on the mesh size, particles carried by liquid or gaseous media can be prevented from passing through. Units or housing interiors are thereby protected from foreign objects which can impair function or durability due to their size.
The housing is separately bolted through a union nut, making assembly/disassembly easier and allowing the strainer insert to be exchanged if necessary.
Replacement or maintenance Stainless Steel-Strainers are available under the GN 7403.1 (see page 1738) standard.

ACCESSORY

- Stainless Steel-Strainers GN 7403.1 (see page 1738)

GN 7403.1

Stainless Steel-Strainers

SPECIFICATION

Strainer
Stainless Steel mesh **NI**
AISI 304

Strainer bezel
Plastic (Polyamide PA)

- glass fibre reinforced
- temperature resistant up to 100 °C

INFORMATION

GN 7403.1 Stainless-Steel-Strainers are adapted for use as replacements for GN 7405 (see page 1737) strainer fittings. They are also suitable for the application-specific assembly of upstream or downstream protection devices.
Depending on the mesh size, particles carried by liquid or gaseous media can be prevented from passing through. Units or housing interiors are thereby protected from foreign objects which can impair function or durability due to their size.
The assembly space required is shown in the drawing. An additional O-ring is generally mounted at the circumference as a seal.

ON REQUEST

- other mesh sizes
- Plastic strainer mesh

TECHNICAL INFORMATION

- Plastic characteristics (see page A2)
- Stainless Steel characteristics (see page A26)

GN 744

Oil level sight glasses

Aluminium / crystal-clear plastic

SPECIFICATION

Types

- Type **A**: with prismatic effect (only d1 = 14/18/24)
- Type **B**: without contrast screen (all sizes)
- Type **C**: with red marking ring (only d1 = 11/14/18/24)

Body
Aluminium
fine turned

Sight glass
Plastic

- crystal-clear Polymide (PA-T)
- temperature resistant up to 110 °C

Red marking ring
pad printing

Sealing ring
Rubber NBR (Perbunan)

INFORMATION

Oil level sight glasses GN 744 use the so called prismatic effect of a cat's eye to display the oil level unaffected by oil colour or oil viscosity. The advantage of this effect is particularly obvious in the case of under or overfilling or for inspection under unfavourable light conditions.
The seal is housed in a radial groove in the aluminium body and hence cannot be lost. In addition it cannot be extruded when thigtening the sight glass.
Oil level sight glasses GN 744 can also be used on pressurised tanks. Data of pressure an vacuum pressure tests is available.
Assembly instruction:
For mounting on walls of less than 4 mm thickness please use a fixing nut GH. (see page 1743)

ACCESSORY

- Fixing nut GH. (see page 1743)

ON REQUEST

- EPDM seal

TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)
- Plastic characteristics (see page A2)

Oil level indicators

Technopolymer

MATERIAL
Transparent polyamide based (PA-T) technopolymer. Avoid contact with alcohol or detergents containing alcohol.

STAR-SHAPED CONTRAST SCREEN
Matte anodised aluminium with red central level point.

PACKING RING
NBR synthetic rubber.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C.

FEATURES
The particular shape of the magnifying lens increases and improves visibility even from side positions.

TECHNICAL DATA
The tightening torque indicated in the table guarantees an optimal tightness, keeping the packing ring in the correct position.

NOTE
For use with other fluids with special additives, please contact ELESA Sales Department.

ACCESSORIES ON REQUEST
Brass nut type GH. (see page 1743) for fitting to reservoirs with wall thickness smaller than 5 mm.

Oil level sight glasses

Aluminium / Perspex / without thread

SPECIFICATION

Types

- Type **A**: without oil level mark
- Type **B**: with oil level mark

Ring nut
Aluminium

Sight glass
Perspex (PMMA)
temperature resistant up to 80 °C

Sealing ring
Rubber NBR (Perbunan)

Contrast screen
Plastic
white, with red oil level marks

INFORMATION

This oil level glass GN 537 does not require a thread.
The oil level sight glass is inserted into the bore d_2 to H11. By simply tightening the ring nut using the pin key the seal is pressed against the contact surface which, at the same time, will hold the sight glass in position. For removal reverse the procedure.
Their application is limited to non-pressurised or only slightly pressurised tanks.

ACCESSORY

- Pin key for installation GN 537.1 (Code no. see table)

TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)

HCFE-C

RoHS PA-T +100° -30°

Oil circulation sights

Technopolymer

MATERIAL
Transparent polyamide based (PA-T) technopolymer. Avoid contact with alcohol or detergents containing alcohol.

CIRCLE FOR OIL LEVEL CHECK
Delimited by a small red coloured externally tampoprinted circle. Tampoprinting resistant to oils with additives, greases, alkali and white spirit; resistant to abrasions under normal working conditions. Avoid contact with solvents, alcohol or detergents containing alcohol.

PACKING RING
NBR synthetic rubber.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C.

TECHNICAL DATA
The tightening torque indicated in the table guarantees an optimal tightness, keeping the packing ring in the correct position.

NOTE
For use with other fluids with special additives, please contact ELESA Sales Department.

ACCESSORIES ON REQUEST
Brass nut type GH. (see page 1743) for fitting to reservoirs with wall thickness smaller than 5 mm.

ELESA Original design

Transparent polyamide based (PA-T) technopolymer. Avoid contact with alcohol or detergents containing alcohol.

PACKING RING
NBR synthetic rubber.

ATEX DIRECTIVE COMPLIANCE
The level indicators of the HCFE-EX series comply with Health and Safety Requirements intended in 94/9/EC ATEX European Directive (explosive atmospheres) for equipments in Group II, category 2GD.
Level indicators have "kX" protection degree and can therefore be mounted on equipment protected by means of "immersion in liquid", without lowering protection degree.
II 2 G D k T6, marked on the HCFE-EX level indicators, represents the identification according to ATEX directive.
II: group of substances for which the product is suitable
2: identification of the category
G: identification of the type of explosive atmosphere (Gases or vapours)
D: identification of the type of explosive atmosphere (Dust)
k: protection degree by means of immersion in liquid
IIB: explosive gases group (only for HCFE.20)
T6: temperature class
Ambient and/or fluid temperature: -30 to +80°C
The declaration of conformity to European Directives of this product is available and it is part of the product itself.

TECHNICAL DATA
The tightening torque indicated in the table guarantees an optimal tightness, keeping the packing ring in the correct position.

NOTE
For use with other fluids with special additives, please contact ELESA Sales Department.

ACCESSORIES ON REQUEST
Brass nut type GH. (see page 1743) for fitting to reservoirs with wall thickness smaller than 5 mm.

Visual flow indicators

Technopolymer ends

ENDS
Polypropylene based (PP) technopolymer, black colour, matte finish.

AXIS AND ROTOR PROPELLER
Polypropylene based (PP) technopolymer, red colour.

TUBULAR WINDOW
PYREX® glass, high-resistance, also suitable for use with glycol-based solutions.
Maximum visibility of the flow from all angles.

TIE RODS
Nickel-plated brass.

PACKING RINGS
NBR synthetic rubber.

THREADED FITTINGS
Brass bosses with cylindrical gas thread according to UNI ISO 228/1.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100° C.

FEATURES AND APPLICATIONS
The indicator can be mounted in any position.
In case of mounting on rigid tubes, it is recommended to place the indicator perfectly aligned with the tubes.
The indicator operates with two-way liquid flows.
For rotating the propeller it is required a minimum fluid flow rate (Q**) depending on the type of fluid and its viscosity (shown in cSt, see table)

SPECIAL EXECUTIONS ON REQUEST
- AISI 316 stainless steel bosses.
- Bosses with NPT conical threads.
- Axis and rotor propeller in blue colour.

Column level indicators

with or without protection frame, technopolymer

ELESA Original design

MATERIAL
Transparent polyamide based (PA-T) technopolymer. Resistant to shocks, solvents, oils with additives, aliphatic and aromatic hydrocarbons, petrol, naphtha, phosphoric esters.
Avoid contact with alcohol and detergents containing alcohol.

PROTECTION FRAME
Glass-fibre reinforced polyamide (PA) SUPER-technopolymer, black colour, matte finish. Supplied assembled, removable by a screwdriver.

SCREWS AND NUTS
Zinc-plated steel.

PACKING RINGS
Step-shaped for the seal on the reservoir walls and NBR synthetic rubber O-ring screw underhead.
Suggested roughness of the packing ring application surface Ra = 3 µm.

CONTRAST SCREEN
White lacquered aluminium. The housing, in the appropriate external rear slot, guarantees the best protection from direct contact with fluid.
It can be taken out from the inclined side, before assembly to allow the insertion of level lines or words.

STANDARD EXECUTIONS
- **HCZ**: without thermometer and without protection frame.
- **HCZ/T**: with thermometer incorporated, without protection frame.
- **HCZ-P**: without thermometer, with protection frame.
- **HCZ/T-P**: with thermometer incorporated and protection frame.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
90°C (with oil).

FEATURES AND PERFORMANCES
Ultrasound welding to guarantee a perfect seal.
Lens effect for a better visibility of the fluid level and temperature.
Special openings in the protection frame provide maximum fluid level visibility even from side positions.
All shocks are absorbed by the frame that transmits them directly onto the wall of the reservoir.

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the weld stood up to: 18 bar (HCZ.76 and HCZ.127) 12 bar (HCZ.254).
For use with other fluids and under different pressure and temperature conditions, please contact ELESA Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.

SPECIAL EXECUTIONS ON REQUEST
- HCZ.127: with M10 screws and nuts.
- UV resistant transparent technopolymer indicators.

Column level indicators

SUPER-technopolymer assembly screws, with or without protection frame

MATERIAL
Transparent polyamide based (PA-T) technopolymer. Highly resistant to shocks, solvents, oils with additives, aliphatic and aromatic hydrocarbons, petrol, naphtha, phosphoric esters.
Avoid contact with alcohol or detergents containing alcohol.

PROTECTION FRAME
Glass-fibre reinforced polyamide (PA) SUPER-technopolymer, black colour, matte finish. Supplied assembled, removable by a screwdriver.

SCREWS
Glass-fibre reinforced polyamide (PA) SUPER-technopolymer, lightweight and high mechanical strength.
Anticorrosive material: suitable even in the presence of liquid or humidity.
Resistant to several washing cycles with solvents and detergents, for this reason it is suitable for applications in the pharmaceutical or food industry.

NUTS AND WASHERS
AISI 304 stainless steel.

PACKING RINGS
Step-shaped for the seal on the reservoir walls and NBR synthetic rubber O-ring screw underhead.
Suggested roughness of the packing ring application surface Ra = 3 µm.

CONTRAST SCREEN
White lacquered aluminium. The housing, in the appropriate external rear slot, guarantees the best protection from direct contact with fluid.
It can be taken out from the inclined side, before assembly to allow the insertion of level lines or words.

STANDARD EXECUTIONS
- **HCZ-VT**: without thermometer and without protection frame.
- **HCZ/T-VT**: with thermometer incorporated, without protection frame.
- **HCZ-P-VT**: without thermometer, with protection frame.
- **HCZ/T-P-VT**: with thermometer incorporated and protection frame.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
90°C (with oil).

SPECIAL EXECUTIONS ON REQUEST
UV resistant transparent technopolymer indicators.

ELESA Original design

FEATURES AND PERFORMANCES
Thanks to the SUPER-technopolymer screws, HCZ-VT column level indicator can be used in corrosion resistance applications where stainless steel is not necessary.
The special slotted head of the SUPER-technopolymer screws is especially designed to reach an optimum tightening of the packing rings by applying an adequate tightening torque (ELESA patent) thus avoiding unnecessary stress to the screws.
Ultrasound welding to guarantee a perfect seal.
Lens effect for a better visibility of the fluid level and temperature.
Special openings in the protection frame provide maximum fluid level visibility even from side positions.
All shocks are absorbed by the frame that transmits them directly onto the wall of the reservoir.

TECHNICAL DATA
Considering the SUPER-technopolymer screws, the maximum working pressure cannot be higher than 5 bar at 20°C and 2 bar at 90°C.
For higher pressure values use HCZ-SST with stainless steel screws.
For use with other fluids and under different pressure and temperature conditions, please contact ELESA Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.

Column level indicators

Technopolymer

MATERIAL
Transparent polyamide based (PA-T) technopolymer. Highly resistant to shocks, solvents, oils with additives, aliphatic and aromatic hydrocarbons, petrol, naphtha, phosphoric esters.
Avoid contact with alcohol or detergents containing alcohol.

SCREWS, NUTS AND WASHERS
Zinc-plated steel.

PACKING RINGS
NBR synthetic rubber O-Ring.
Suggested roughness of the packing ring application surface Ra = 3 µm.

CONTRAST SCREEN
White lacquered aluminium. The housing, in the appropriate external rear slot, guarantees the best protection from direct contact with fluid.
It can be taken out from the inclined side, before assembly to allow the insertion of level lines or words.

STANDARD EXECUTIONS
- **HCX.**: without thermometer.
- **HCX/T**: with incorporated thermometer.

MOUNTING
When fitting is not possible from the inside of the reservoir and the walls are not thick enough, the screws can be used together with Fast Mounting Kit (see page 1768).

MAXIMUM CONTINUOUS WORKING TEMPERATURE
90°C (with oil).

FEATURES AND PERFORMANCES
Ultrasound welding to guarantee a perfect seal.
Maximum fluid level visibility even from side positions.
Lens effect for a better visibility of the fluid level and temperature.

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the weld stood up to: 18 bar (HCX.76 e HCX.127) 12 bar (HCX.254).
For use with other fluids and under different pressure and temperature conditions, please contact ELESA Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.

OTHER STANDARD EXECUTIONS
- HCX-AR (see page 1763) for use with fluids containing alcohol.
- HCX-BW-SST (see page 1762) for use with hot water.
- HCX-PT (see page 1764) with SUPER-technopolymer protection frame.

SPECIAL EXECUTIONS ON REQUEST
- UV resistant transparent technopolymer indicators.
- Indicators with two red ball-shaped floats (only for the execution without thermometer).
- Indicators with cylindrical or step-shaped (NBR or FKM) packing rings (instead of OR) for mounting on reservoirs having rough surfaces or in any case not perfectly flat.

Avoid contact with alcohol or detergents containing alcohol.

SCREWS, NUTS AND WASHERS
AISI 303 stainless steel screws, AISI 304 stainless steel nuts and washers.

PACKING RINGS
FKM type VITON®*O-Ring.
Suggested roughness of the packing ring application surface Ra = 3 µm.

CONTRAST SCREEN
White lacquered aluminium. The housing, in the appropriate external rear slot, guarantees the best protection from direct contact with fluid.
It can be taken out from the inclined side, before assembly to allow the insertion of level lines or words.

STANDARD EXECUTIONS
- **HCX-SST**: without thermometer.
- **HCX/T-SST**: with incorporated thermometer.

MOUNTING
When fitting is not possible from the inside of the reservoir and the walls are not thick enough, the screws can be used together with Fast Mounting Kit (see page 1768).

MAXIMUM CONTINUOUS WORKING TEMPERATURE
90°C (with oil).

FEATURES AND PERFORMANCES
Ultrasound welding to guarantee a perfect seal.
Maximum fluid level visibility even from side positions.
Lens effect for a better visibility of the fluid level and temperature.

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the weld stood up to: 18 bar (HCX.76-SST and HCX.127-SST) 12 bar (HCX.254-SST).
For use with other fluids and under different pressure and temperature conditions, please contact ELESA Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.

OTHER STANDARD EXECUTIONS
- HCX-AR (see page 1763) for use with fluids containing alcohol.
- HCX-BW-SST (see page 1762) for use with hot water.
- HCX-PT (see page 1764) with SUPER-technopolymer protection frame.

SPECIAL EXECUTIONS ON REQUEST
- UV resistant transparent technopolymer indicators.
- Indicators with two red ball-shaped floats (only for the execution without thermometer).
- Indicators with cylindrical or step-shaped (NBR or FKM) packing rings (instead of OR) for mounting on reservoirs having rough surfaces or in any case not perfectly flat.

*** Registered trademark by DuPont Dow Elastomers.**

Maximum tightening torque

Column level indicators

SUPER-technopolymer assembly screws

MATERIAL
Transparent polyamide based (PA-T) technopolymer. Highly resistant to shocks, solvents, oils with additives, aliphatic and aromatic hydrocarbons, petrol, naphtha, phosphoric esters.
Avoid contact with alcohol or detergents containing alcohol.

SCREWS
Glass-fibre reinforced polyamide based (PA) SUPER-technopolymer

NUTS AND WASHERS
AISI 304 stainless steel.

PACKING RINGS
NBR synthetic rubber (on request FKM) O-Ring.
Suggested roughness of the packing ring application surface Ra = 3 µm.

CONTRAST SCREEN
White lacquered aluminium. The housing, in the appropriate external rear slot, guarantees the best protection from direct contact with fluid. It can be taken out from the inclined side, before assembly to allow the insertion of level lines or words.

STANDARD EXECUTIONS
- **HCX-VT**: without thermometer.
- **HCX/T-VT**: with incorporated thermometer.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
90°C (with oil).

FEATURES AND PERFORMANCES
Thanks to the SUPER-technopolymer screws, HCX/VT column level indicator can be used in corrosion resistance applications where stainless steel is not necessary.
The special slotted head of the SUPER-technopolymer screws is especially designed to reach an optimum tightening of the packing rings by applying an adequate tightening torque (ELESA patent) thus avoiding unnecessary stress to the screws.
Ultrasound welding to guarantee a perfect seal.
Maximum fluid level visibility even from side positions.
Lens effect for a better visibility of the fluid level and temperature.

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the weld stood up to: 18 bar (HCX.127-VT) 12 bar (HCX.254-VT).
Considering the SUPER-technopolymer screws, the maximum working pressure cannot be higher than 5 bar at 20°C and 2 bar at 90°C.
For use with other fluids and under different pressure and temperature conditions, please contact ELESA Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.

ANOTHER STANDARD EXECUTION
HCX-PT (see page 1764) with SUPER-technopolymer protection frame.

SPECIAL EXECUTIONS ON REQUEST
- UV resistant transparent technopolymer indicators.
- Indicators with two red ball-shaped floats (only for the execution without thermometer).
- Indicators with cylindrical or step-shaped (NBR or FKM) packing rings (instead of OR) for mounting on reservoirs having rough surfaces or in any case not perfectly flat.

Maximum tightening torque

HCX-BW-SST

Column level indicators

for hot water, technopolymer

MATERIAL
Transparent polyamide based (PA-T) technopolymer. Highly resistant to shocks, solvents, oils with additives, aliphatic and aromatic hydrocarbons, petrol, naphtha, phosphoric esters.
Avoid contact with alcohol or detergents containing alcohol.
The special technopolymer used for HCX-BW-SST column level indicator allows to use it even in circuits working with very hot water and prevents milk effect on the transparent surface.

SCREWS, NUTS AND WASHERS
AISI 303 stainless steel screws, AISI 304 stainless steel nuts and washers.

PACKING RINGS
FKM type VITON®*O-Ring.
Suggested roughness of the packing ring application surface Ra = 3 µm.

CONTRAST SCREEN
White lacquered aluminium. The housing, in the appropriate external rear slot, guarantees the best protection from direct contact with fluid. It can be taken out from the inclined side, before assembly to allow the insertion of level lines or words.

MOUNTING
When fitting is not possible from the inside of the reservoir and the walls are not thick enough, the screws can be used together with Fast Mounting Kit (see page 1768).

MAXIMUM CONTINUOUS WORKING TEMPERATURE
80°C with peaks of 90°C.

FEATURES AND PERFORMANCES
Ultrasound welding to guarantee a perfect seal.
Maximum fluid level visibility even from side positions.
Lens effect for a better visibility of the fluid level.

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the weld stood up to 10 bar.
For use with other fluids and under different pressure and temperature conditions, please contact ELESA Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.

SPECIAL EXECUTIONS ON REQUEST
- Level indicators with SUPER-technopolymer protection frame.
- Indicators with two red ball-shaped floats (only for the execution without thermometer).

HCX-AR

Column level indicators

for use with fluids containing alcohol, technopolymer

ELESA Original design

MATERIAL
Transparent polyamide based (PA-T/AR) technopolymer. Highly resistant to shocks, solvents, oils with additives, aliphatic and aromatic hydrocarbons, petrol, naphtha, phosphoric esters, additives and detergents containing alcohol.

SCREWS, NUTS AND WASHERS
Zinc-plated steel.

PACKING RINGS
NBR synthetic rubber O-Ring.
Suggested roughness of the packing ring application surface Ra = 3 µm.

CONTRAST SCREEN
White lacquered aluminium. The housing, in the appropriate external rear slot, guarantees the best protection from direct contact with fluid. It can be taken out from the inclined side, before assembly to allow the insertion of level lines or words.

STANDARD EXECUTIONS
- **HCX-AR**: without thermometer.
- **HCX/T-AR**: with incorporated thermometer.

MOUNTING
When fitting is not possible from the inside of the reservoir and the walls are not thick enough, the screws can be used together with Fast Mounting Kit (see page 1768).

MAXIMUM CONTINUOUS WORKING TEMPERATURE
80°C.

FEATURES AND PERFORMANCES
Ultrasound welding to guarantee a perfect seal.
Maximum fluid level visibility even from side positions.
Lens effect for a better visibility of the fluid level and temperature.

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the weld stood up to: 13 bar (HCX.76-AR and HCX.127-AR) 10 bar (HCX.254-AR).
For use with other fluids and under different pressure and temperature conditions, please contact ELESA Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.

SPECIAL EXECUTIONS ON REQUEST
- Level indicators with with SUPER-technopolymer protection frame.
- Indicators with two red ball-shaped floats (only for the execution without thermometer).
- Indicators with cylindrical or step-shaped (NBR or FKM) packing rings (instead of OR) for mounting on reservoirs having rough surfaces or in any case not perfectly flat.

Maximum tightening torque

HCX-PT

Column level indicators

with SUPER-technopolymer protection frame

INDICATOR BODY
Transparent polyamide based (PA-T) technopolymer. Highly resistant to shocks, solvents, oils with additives, aliphatic and aromatic hydrocarbons, petrol, naphtha, phosphoric esters.
Avoid contact with alcohol or detergents containing alcohol.

PROTECTION FRAME
Glass-fibre reinforced polyamide based (PA) SUPER-technopolymer, black colour, matte finish. Supplied assembled, removable by a screwdriver.

SCREWS, NUTS AND WASHERS
- Zinc-plated steel. (HCX-PT).
- AISI 303 stainless steel screws, AISI 304 stainless steel nuts and washers. (HCX-PT-SST).
- Glass-fibre reinforced polyamide based (PA) SUPER-technopolymer screws, AISI 304 stainless steel nuts and washers. (HCX-PT-VT).

PACKING RINGS
- NBR synthetic rubber O-Ring. (HCX-PT and HCX-PT-VT).
- FKM type VITON®*O-Ring. (HCX-PT-SST).

Suggested roughness of the packing ring application surface Ra = 3 µm.

CONTRAST SCREEN
White lacquered aluminium. The housing, in the appropriate external rear slot, guarantees the best protection from direct contact with fluid. It can be taken out from the inclined side, before assembly to allow the insertion of level lines or words.

STANDARD EXECUTIONS
- **HCX-PT**: without thermometer. Zinc-plated steel screws, nuts and washers.
- **HCX/T-PT**: with incorporated thermometer. Zinc-plated steel screws, nuts and washers.
- **HCX-PT-SST**: without thermometer. AISI 303 stainless steel screws, AISI 304 stainless steel nuts and washers.
- **HCX/T-PT-SST**: with incorporated thermometer. AISI 303 stainless steel screws, AISI 304 stainless steel nuts and washers.
- **HCX-PT-VT**: without thermometer. Glass-fibre reinforced polyamide based (PA) SUPER-technopolymer screws, AISI 304 stainless steel nuts and washers.
- **HCX/T-PT-VT**: with incorporated thermometer. Glass-fibre reinforced polyamide based (PA) SUPER-technopolymer screws, AISI 304 stainless steel nuts and washers.

MOUNTING
When fitting is not possible from the inside of the reservoir and the walls are not thick enough, the screws can be used together with Fast Mounting Kit (see page 1768).

MAXIMUM CONTINUOUS WORKING TEMPERATURE
90°C (with oil).

FEATURES AND PERFORMANCES
Ultrasound welding to guarantee a perfect seal.
Lens effect for a better visibility of the fluid level and temperature.
Special openings in the protection frame provide maximum fluid level visibility even from side positions.
All shocks are absorbed by the frame that transmits them directly onto the wall of the reservoir.

ELESA Original design

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the weld stood up to: 18 bar (HCX.76-PT e HCX.127-PT) 12 bar (HCX.254-PT).

Maximum tightening torque

Column level indicators

technopolymer, with zinc alloy protection frame

ELESA Original design

MATERIAL
Transparent polyamide based (PA-T) technopolymer. High resistance to shocks, solvents, oils with additives, aliphatic and aromatic hydrocarbons, petrol, naphtha, phosphoric esters.
Avoid contact with alcohol or detergents containing alcohol.

PROTECTION FRAME
Zinc-alloy, sandblasted and treated finish.

SCREWS, NUTS AND WASHERS
Zinc-plated steel.

PACKING RINGS
Step-shaped for the seal on the reservoir walls and NBR synthetic rubber O-ring screw underhead.

CONTRAST SCREEN
White lacquered aluminium. The housing, in the appropriate external rear slot, guarantees the best protection from direct contact with fluid. It can be taken out from the inclined side, before assembly to allow the insertion of level lines or words.

STANDARD EXECUTIONS
- **HCX-P**: without thermometer.
- **HCX/T-P**: with incorporated thermometer.

MOUNTING
When fitting is not possible from the inside of the reservoir and the walls are not thick enough, the screws can be used together with Fast Mounting Kit (see page 1768).

MAXIMUM CONTINUOUS WORKING TEMPERATURE
90°C (with oil).

FEATURES AND PERFORMANCES
Ultrasound welding to guarantee a perfect seal.
Lens effect for a better visibility of the fluid level and temperature.
Special openings in the protection frame provide maximum fluid level visibility even from side positions.
All shocks are absorbed by the frame that transmits them directly onto the wall of the reservoir

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the weld stood up to 18 bar.
For use with other fluids and under different pressure and temperature conditions, please contact ELESA Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.

SPECIAL EXECUTIONS ON REQUEST
- Level indicators for use with fluids containing alcohol or with hot water.
- UV resistant transparent technopolymer indicators.
- Protection frame with indicators type HCX-SST (see page 1758), HCX-BW-SST (see page 1762), HCX-AR (see page 1763).
- Indicators with two red ball-shaped floats (only for the execution without thermometer).
- Indicators with cylindrical or step-shaped (NBR or FKM) packing rings (instead of OR) for mounting on reservoirs having rough surfaces or in any case not perfectly flat.

Maximum tightening torque

Fast Mounting Kit

Steel and rubber

NUT
Zinc-plated steel.

PACKING RING
NBR synthetic rubber.

FEATURES
The FM kit (fast mounting kit) has been designed for mounting level indicators series HCX. from the outside when nuts cannot be fitted from the inside of the reservoir.

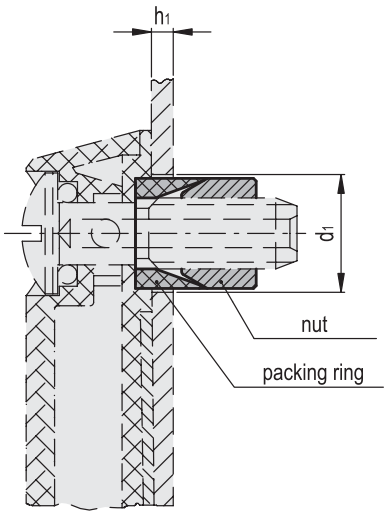
ASSEMBLY OF THE INDICATOR WITH THE FM KIT (FAST MOUNTING KIT)

- Arrange the holes d_1 as reported in the table and make sure that the holes in the plate do not have any burs, especially inside the reservoir.
- Unscrew the nuts from the HCX. indicator and take out the washers supplied with the standard execution, put the packing ring inside and screw the nuts (with or without O-Ring according to the thickness h_1).
- Before assembly of the indicator on the reservoir, slightly tighten the nut by hand against the packing ring.

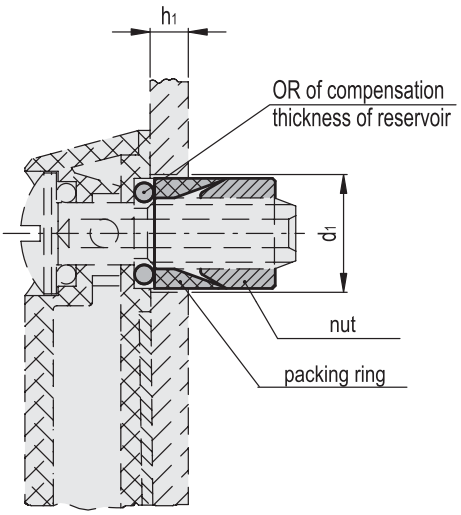
We advise you, then, to deform slightly the threaded end of the screw in order to prevent the nut from falling into the reservoir while disassembling the indicator.

- To disassemble the indicator from the reservoir, just rotate the screw 3/4 of a turn keeping the plastic part of the indicator under tension (pulling).

$1.5 < h_1 < 4.7$
(assembly without O-ring)



$4.7 < h_1 < 6.3$
(assembly with O-ring)



Code	Description	d_1 +0.1	Without O-ring h_1 min	Without O-ring h_1 max	With O-ring h_1 min	With O-ring h_1 max	Tightening torque max. [Nm]

HCX-LT

Column level indicator

with float for indirect level reading, technopolymer

MATERIAL
Transparent polyamide based (PA-T) technopolymer. High resistance to shocks, solvents, oils with additives, aliphatic and aromatic hydrocarbons, petrol, naphtha, phosphoric esters.
Avoid contact with alcohol or detergents containing alcohol.

SCREWS, NUTS AND WASHERS
Zinc-plated steel.

PACKING RINGS
NBR synthetic rubber O-Ring.
Suggested roughness of the packing ring application surface Ra = 3 µm.

FLOAT
Ebonite, black colour.

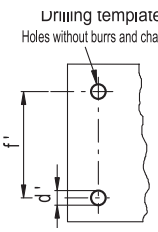
CONTRAST SCREEN
White lacquered aluminium. The housing, in the appropriate external rear slot, guarantees the best protection from direct contact with fluid. It can be taken out from the inclined side, before assembly to allow the insertion of level lines or words.

MOUNTING
When fitting is not possible from the inside of the reservoir and the walls are not thick enough, the screws can be used together with Fast Mounting Kit (see page 1768).

MAXIMUM CONTINUOUS WORKING TEMPERATURE
90°C (with oil).

FEATURES AND PERFORMANCES
HCX-LT column level indicator allows the fluid level reading by means of a float when, due to the particular design of the system, the fluid level cannot be seen directly from the lower part of the indicator.
The plastic foam float is moved upward by the fluid contained in the reservoir. This system allows an indirect reading of the level.
The red line on the lacquered contrast screen is visible only when the float is in its lowest position (minimum fluid level = m).
Ultrasound welding to guarantee a perfect seal.
Maximum fluid level visibility even from side positions.
Lens effect for a better visibility of the fluid level.

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the weld stood up to 12 bar.
For use with other fluids and under different pressure and temperature conditions, please contact ELESA Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.



ELESA Original design

SPECIAL EXECUTIONS ON REQUEST
Level indicators with SUPER-technopolymer protection frame.
UV resistant transparent technopolymer indicators.

ASSEMBLY INSTRUCTIONS
To ensure proper assembly of the indicator, please follow these instructions:
1. Set the minimum oil level of your reservoir.
2. Drill two holes on the reservoir wall. The lower hole axis should be drilled at "m" distance (see table) under the minimum oil level.

"m" is the minimum oil level allowed. This is the level from which the float starts to be moved upward.
The value "m" is calculated with an oil density of 875 Kg/m³ at 15°C.
If the red line of the contrast screen appears, the oil level is under its minimum level allowed.

Maximum tightening torque

RoHS PA PC +100° -30°

Column level indicators

with or without transparent protection, technopolymer

ASSEMBLY ENDS
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour.

SUPPORT
Aluminium in natural colour.

LEVEL COLUMN WINDOW
Polycarbonate transparent tube.
Maximum fluid level visibility even from side positions

SCREWS, NUTS AND WASHERS
Zinc-plated steel.

PACKING RINGS
NBR rubber O-Ring.

GRADUATED CONTRAST SCREEN
White lacquered aluminium. It can be taken out before assembly to allow the insertion of level lines or words.
Fitted to the aluminium support.

STANDARD EXECUTIONS
- **HCK:** with transparent front protection (against accidental shocks), in polycarbonate (PC), extractable for cleaning operations.
- **HCK-NP:** without transparent front protection.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
100°C (with oil).

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the values of pressure resistance were much higher than 35 bar.
If you need to use the indicator with other oils or fluids and under different pressure and temperature conditions, please contact ELESA+GANTER Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.

SPECIAL EXECUTIONS ON REQUEST
- Column level window in transparent methylmatacrylate (PMMA) for max 70°C use.
- AISI 303 stainless steel screws with hexagon socket.
- Polyamide based technopolymer float (from HCK.127) red colour.
- Expanded NBR float (from HCK.176) black colour with AISI 316 stainless steel spiral for special executions, viscous liquids, high temperatures.
- Column level window with visibility (l_2) superior to 452 mm and holes centre distance (f) for fixing up to 1.500 mm.
- Electric sensor bracket pre-set at the following temperatures: 50°C, 60°C, 70°C, 80°C.
- Packing rings in special material depending on the customer's needs.
- Built-in thermometer with red indication line.
- External scale thermometer (Fig. 1) with internal probe for fluid temperature.
- SLCK electric level sensor (Fig.2, from HCK.127) which can be fitted along the axis of the indicator according to the actual needs. With right (DX) or left (SX) connectors, normally closed (NC), normally open (NO).
- Special screw with nickel-plated brass tap (Fig. 3) to be fitted to the lower assembly end for any maintenance operation requiring the indicator exclusion.

Maximum tightening torque

SLCK

RoHS | IP65 | PP | +80° -30° | PA | +120° -30°

Kit for the electric control of a fluid level

for HCK. and HCK-GL column level indicators

SENSOR HOLDER BRACKET

In polyamide based (PA) technopolymer, black colour, watertight, with a built-in relay (reed) with two conductors wired to the two-pin connector. It can be moved along the axis of the indicator and secured in the preferred position with the appropriate screw (set screw) in technopolymer.

ELECTRIC SENSOR

- NO: the electric circuit closes on reaching the preset level.
- NC: the electric circuit opens on reaching the preset level.

CONNECTOR

With built-in cable gland and contact holders.Properly set, it offers an effective product protection against water sprays (IP 65 protection class according to EN 60529 table on page A23) that can be increased during installation with the necessary adjustments. NBR synthetic rubber packing rings.

FLOAT

Polypropylene based (PP) technopolymer, max temperature limit 80° C or polyamide based (PA) technopolymer, max temperature limit 120°C, max chemical compatibility, black colour.
The float incorporates a magnetic element to activate the electric contact. When the float reaches the intervention level set by the user, by suitably positioning the sensor holder along the axis of the indicator, the electrical contact activates.
Max operating pressure 2 bar (operation with oil).

SPACERS

In polyamide based (PA) technopolymer. Essential in cases where the reservoir is made out of ferromagnetic material in order to prevent the interaction between the magnet and the metal mass of the reservoir.

KIT

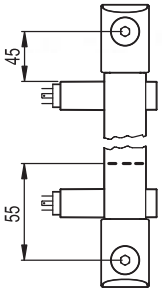
The kit includes one or two sensor holder brackets, a float, 4 O-rings (2 FKM for HCK-GL and 2 NBR for HCK) and two spacers.
It is possible to apply more than one kit to get the electric control of different levels, consistently with the height of the transparent column.

STANDARD EXECUTIONS

For applications with temperatures up to 80°C: polypropylene based (PP) technopolymer float.
- **SLCK-NO**: with electric contact normally open.
- **SLCK-NC**: with electric contact normally closed.
- **SLCK-NO-NC**: with one electric contact normally open and one electric contact normally closed.
- **SLCK-NC-NC**: with two electric contacts normally closed.
- **SLCK-NO-NO**: with two electric contacts normally open.

For applications with temperatures up to 120°C: polyamide based (PA) technopolymer float.
- **SLCK-HT-NO**: with electrical contact normally open.
- **SLCK-HT-NC**: with electrical contact normally closed.
- **SLCK-HT-NO-NC**: with one electrical contact normally open and one electric contact normally closed.
- **SLCK-HT-NC-NC**: with two electrical contacts normally closed.
- **SLCK-HT-NO-NO**: with two electrical contacts normally opened.

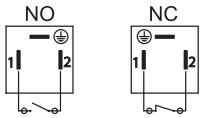
Fig.1



ELESA Original design

FEATURES AND PERFORMANCES

With the application of the SLCK kit, HCK. and HCK-GL column level indicators provide an electric signal when the fluid level reaches the level of preset intervention, besides the visual control of the level. The electric control of the level can be applied on all versions of HCK. from the version with 127 mm hole centre distance while always maintaining the visibility of fluid level even from side positions.
In the highest position, the sensor holder must be positioned at least 45 mm below the axis of the high screw (Fig.1), so that the switching takes place correctly.
In the lowest position, the fluid level which determines the switching of the electric circuit is about 55 mm above the axis of the low screw of fluid supply (data referring to mineral oil type CB68, according to ISO 3498, temperature 23°C) (Fig. 1).
The sensor holder is arranged to be installed to the left with respect to the axis of the indicator. However, if required it can also be mounted on the right. The connector can be rotated by 90° in four positions when wiring.
For a correct assembly see Warnings (on page 1775).



Level sensor electric characteristics	
Tension feed	AC/DC
Electric contacts	NO normally open NC normally close
Maximum applicable voltage	230 Vdc / Vac
Max. opening capacity (CC CA)	2 A
Maximum commutable power	40 W / VA
Cable gland	Pg 7 (for cables in sheath with Ø 6 or 7 mm)
Conductors cross-section	Max. 1.5 mm^2
Do not mount this indicator in proximity to magnetic fields.	

SLCK

Kit for the electric control of a fluid level

KIT ASSEMBLY INSTRUCTIONS

- Remove the assembly end of the indicator (Fig. 2).
- Insert the sensor holder bracket (Fig.3).
- Insert the float with the word "up" to the top and relocate the assembly end in place (Fig.4).
- Clamp the bracket with the set screw to the desired position (Fig. 5).
- Install the indicator on the reservoir using the spacers included in the supply (necessary in case of reservoir made out of ferromagnetic material in order to avoid interaction between the magnet and the metal mass (Fig.6).
- Assemble the two-pin connector (Fig. 7).

TWO-PIN CONNECTOR ASSEMBLY INSTRUCTIONS

1. Remove the connector from the sensor holder bracket by unscrewing the axial set screw, take off the contact holder and unscrew the cable gland as required.
2. Slip on the cable into the connector and connect the wires to the terminals of the contact holder.
3. Assemble by pressing the contact holder into the connector (the contact holder can be rotated by 90° in four positions to have a different orientation of the connector).
4. Screw again the connector to the sensor holder by means of the axial set screw and then tighten the cable gland.

Column level indicators

with U shaped protection, technopolymer

ASSEMBLY ENDS
Glass-fibre reinforced polyamide based (PA) technopolymer, black colour.

SUPPORT
Aluminium in natural colour. It can be turned by 90°C where necessary.

LEVEL COLUMN WINDOW
Polymethylmatacrylate transparent tube.

SCREWS
Zinc-plated steel with hexagon socket.

PACKING RINGS
NBR synthetic rubber O-Ring.

GRADUATED CONTRAST SCREEN
Plastic material, resistant to oils and greases. Fitted to the aluminium protection by means of an adhesive tape.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
70°C (with oil or water).

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the weld stood up to: 30 bar (HCL.300), 25 bar (HCL.400) and 20 bar (HCL.500).
For use with other fluids and under different pressure and temperature conditions, please contact ELESA Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.

SPECIAL EXECUTIONS ON REQUEST
- Column level indicators with tubes and assembly ends in different materials for the use with special fluids and/or at high temperatures.
- AISI 316 stainless steel or nickel-plated brass screws.
- Polyamide based (PA) technopolymer float, red colour to highlight the level also from a long distance.
- Column level indicators with fitting centre-holes up to 2000 mm.
- HCL-E column oil level indicators including float, minimum level signal, normally closed contacts (NC), normally open (NO) or CHANGE OVER.
- Adjustable level sensors which can be placed along the axis of the indicator, with right (DX) or left (SX) connectors, normally closed (NC), normally open (NO) or CHANGE OVER contacts.
- EPDM or FKM type VITON®* packing rings.

*** Registered trademark by DuPont Dow Elastomers.**

Maximum tightening torque

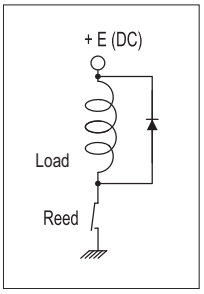
Warnings for an effective protection of the Reed switches

The electric features on the Reed switches, shown in the descriptive tables, are supplied by the manufacturers. For a Reed switch connection, it is recommended to pay special attention to the type of load to which the switch is going to be connected. Inductive, capacitive or lamp loads may produce surges during operation, for their own nature. These surges may damage the Reed switch or drastically reduce its operating life.

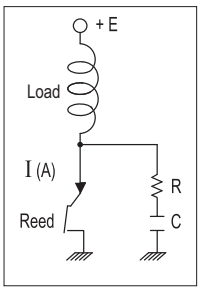
Inductive load

When a Reed switch is used to guide an inductive load such as engines and solenoid valves, the energy stored in the load may cause an inverse voltage when the Reed contact breaks. The voltage depends on the inductance value. The following circuits provide a protection in the cases hereunder mentioned.

In case of continous voltage, it is enough to introduce a diode in parallel to the load respecting the polarity, to advoid any damage to the Reed switch.



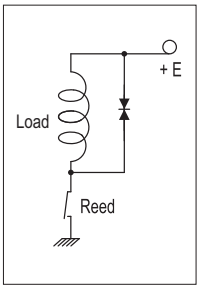
In case of alternating voltage, it is possible to use a resistance and a capacitance in parallel to the Reed switch. The capacitance and resistance values come out from the following formula.



$$C\,[\mu F] = \frac{I^2}{10}$$

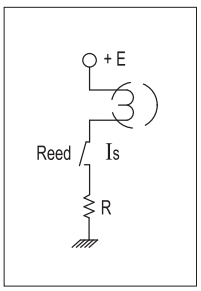
$$R\,[\Omega] = \frac{E}{10 \cdot I\,(1 + \frac{E}{50})}$$

An alternative solution may be to use a varistor in parallel to the load.

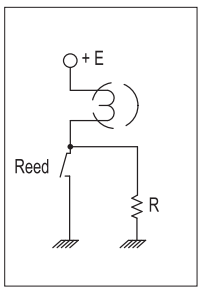


Lamp load

In case of a tungsten filament lamp, the filament resistance is 10 times smaller when the lamp is switched off (cold filament) than in case of the lamp switched on (hot filament). After the Reed contact commutation and after the lamp turning on, for a short time the in-rush current is 10 times higher than the one circulating in steady state. This flow may damage the Reed contact or jeopardise its duration. In this case, the solution is to introduce a resistance in series to the Reed switch, thus cutting the maximum value of the current, or a resistance in parallel to the Reed switch, to keep the filament hot (by increasing the resistance) without causing the lamp to turn on.



R = Protection resistance
It must be properly chosen so that
Is < 0.5 A

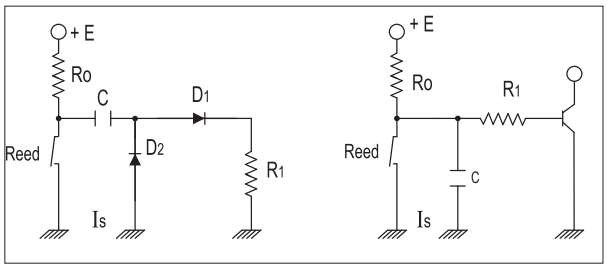


$$R < \frac{\text{Filament resistance}}{3}$$

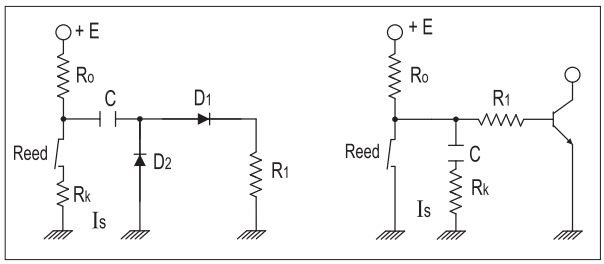
Capacitive load

The in-rush current flowing during charge and discharge of the capacitor will cause deterioration of the Reed contacts in case when a capacitor is connected in series or in parallel with a Reed switch in a closed circuit. In this situation, the easiest and more effective solution is to position a resistance in series to the Reed switch or, in general, a resistance properly set in order to cut the maximum value of the currents of charge and discharge. Here are two examples of a circuit: the energy, stored in the capacitive load "C", generates rush currents discharging through the Reed contact. The use of a properly calibrated resistance reduces the value of these currents and protects the operating life of the Reed contact.

Circuit without protection



Circuit with protection

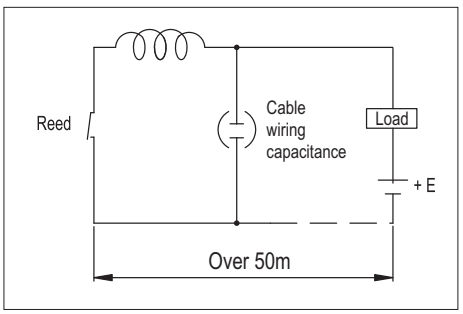


R_k is the resistance limiting the surges.
The R_k resistance value depends on the circuit electric configuration.
As a general rule:

$$Is = \frac{V \text{ stored in the load}}{{}_kR\ [K\Omega]} < 0{,}1\ A$$

Wiring capacitance

In case a Reed switch is connected to a load by a cable, over a long distance, the cable static capacitance will affect the Reed switch. In case the cable length exceeds 50 metres, it is recommended to use a protection for assuring a longer operating life of the Reed switch (although it depends on the type of cable used). In this situation an inductance in series to the Reed switch or a small resistance (current limiting resistance of 10 to 500 ohms) can be inserted.



Column level indicators

with MAX temperature electrical sensor, technopolymer

ELESA Original design

MATERIAL
Transparent polyamide based (PA-T) technopolymer. Highly resistant to shocks, solvents, oils with additives, aliphatic and aromatic hydrocarbons, petrol, naphtha, phosphoric esters.
Avoid contact with alcohol or detergents containing alcohol.

SCREW, NUTS AND WASHERS
Zinc-plated steel.

PACKING RINGS
NBR synthetic rubber O-Ring.
Suggested roughness of the packing ring application surface Ra = 3 µm.

MAX TEMPERATURE ELECTRICAL SENSOR (80°C)
Zinc-plated screw with built-in sensor.
Temperature of intervention is 80°C.
For a correct assembly see Warnings (see page 1777).

SWIVELLING TWO-PIN CONNECTOR
With built-in cable gland and contact holder. Front or side output (right or left) including protection against water sprays (protection class IP 65 according to EN 60529 table on page A23) that can be increased during installation with the necessary adjustments. Flat NBR synthetic rubber packing rings.

CONTRAST SCREEN
White lacquered aluminium. The housing, in the appropriate external rear slot, guarantees the best protection from direct contact with fluid. It can be taken out from the inclined side, before assembly to allow the insertion of level lines or words.

STANDARD EXECUTIONS
- **HCX-ST-NO**: with electrical contact normally open.
- **HCX-ST-NC**: with electrical contact normally closed.

MOUNTING
When fitting is not possible from the inside of the reservoir and the walls are not thick enough, the screws can be used together with Fast Mounting Kit (see page 1768).

MAXIMUM CONTINUOUS WORKING TEMPERATURE
90°C (with oil).

SPECIAL EXECUTIONS ON REQUEST
- Level indicators with SUPER-technopolymer protection frame.
- Level indicators for use with fluids containing alcohol or with hot water.
- UV resistant transparent technopolymer indicators.
- Temperature electrical sensor with pre-set temperatures different from 80°C.
- Indicators with two red ball-shaped floats.

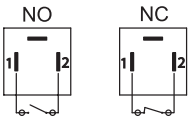
FEATURES AND PERFORMANCES
This column level indicator generates an electric signal when the temperature reaches the pre-set degrees (80°C).
Ultrasound welding to guarantee a perfect seal.
Maximum fluid level visibility even from side positions.
Lens effect for a better visibility of the fluid level and temperature.

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the weld stood up to: 18 bar (HCX.127-ST) 12 bar (HCX.254-ST).
For use with other fluids and under different pressure and temperature conditions, please contact ELESA Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.

FUNCTIONING

- HCX-ST-NO with electrical contact normally open.
Electrical temperature sensor: the electrical circuit is closed when the pre-set temperature at 80°C is reached.
- HCX-ST-NC with electrical contacts normally closed.
Electrical temperature sensor: the electrical circuit is open when the pre-set temperature at 80°C is reached.

Electrical features	MAX temperature sensor	
Tension feed	AC/DC	
Electric contacts	NO normally open NC normally closed	
Voltage / Maximum current	250 Vac - 10 A	(resisteve loads)
	48 Vdc - 5 A	
Cable gland	Pg 7 (for cables in sheath with Ø 6 or 7 mm)	
Conductors cross-section	Max 1.5 mm^2	



TWO-PIN CONNECTOR ASSEMBLY INSTRUCTIONS

1. Remove the connector from the indicator by unscrewing the set screw placed in the bottom, take the contact holder out and loosen the cable gland.
2. Slip on the two-pole cable into the connector (standard connector) and connect the wires to the terminals nr. 1 and nr. 2 of the contact holder.
3. Assemble by pressing the contact holder into the connector in the required position.
4. Screw the connectors to the indicator and then tighten the cable glands.

Column level indicators

with temperature electrical probe, technopolymer

ELESA Original design

MATERIAL
Transparent polyamide based (PA-T) technopolymer. Highly resistant to shocks, solvents, oils with additives, aliphatic and aromatic hydrocarbons, petrol, naphtha, phosphoric esters.
Avoid contact with alcohol or detergents containing alcohol.

SCREW, NUTS AND WASHERS
Zinc-plated steel.

PACKING RINGS
NBR synthetic rubber O-Ring.
Suggested roughness of the packing ring application surface Ra = 3 µm.

TEMPERATURE ELECTRICAL PROBE
Zinc-plated steel screw with built-in probe. The probe is made out of a platinum resistor whose ohmic resistance changes according to the temperature.
For a correct assembly see Warnings (see page 1777).

SWIVELLING TWO-PIN CONNECTOR
With built-in cable gland and contact holder. Front or side output (right or left) including protection against water sprays (protection class IP 65 according to EN 60529 table on page A23) that can be increased during installation with the necessary adjustments. Flat NBR synthetic rubber packing rings.

CONTRAST SCREEN
White lacquered aluminium. The housing, in the appropriate external rear slot, guarantees the best protection from direct contact with fluid.
It can be taken out from the inclined side, before assembly to allow the insertion of level lines or words.

MOUNTING
When fitting is not possible from the inside of the reservoir and the walls are not thick enough, the screws can be used together with Fast Mounting Kit (see page 1768).

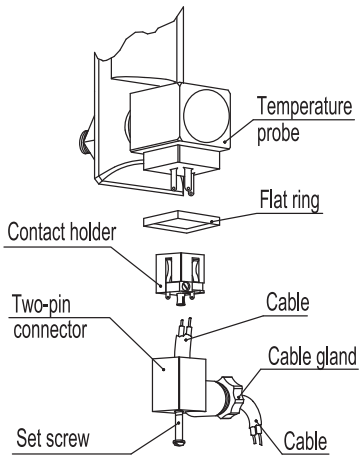
MAXIMUM CONTINUOUS WORKING TEMPERATURE
90°C (with oil).

FEATURES AND PERFORMANCES
This column level indicator generates an analogic electric signal of the oil temperature.
Ultrasound welding to guarantee a perfect seal.
Maximum fluid level visibility even from side positions.
Lens effect for a better visibility of the fluid level and temperature.

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the weld stood up to: 18 bar (HCX.127-STL) 12 bar (HCX.254-STL).
For use with other fluids and under different pressure and temperature conditions, please contact ELESA Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.

SPECIAL EXECUTIONS ON REQUEST
- Level indicators for use with fluids containing alcohol or with hot water.
- UV resistant transparent technopolymer indicators.
- Indicators with two red ball-shaped floats.

TWO-PIN CONNECTOR ASSEMBLY INSTRUCTIONS
1. Remove the connector from the indicator by unscrewing the set screw placed in the bottom, take the contact holder out and loosen the cable gland.
2. Slip on the two-pole cable into the connector (standard connector) and connect the wires to the terminals nr. 1 and nr. 2 of the contact holder.
3. Assemble by pressing the contact holder into the connector in the required position.
4. Screw the connectors to the indicator and then tighten the cable glands.



FUNCTIONING OF THE TEMPERATURE ELECTRICAL PROBE

The working principle of the temperature probe is to measure the variation of resistance of a platinum element: 100 ohm = 0°C, 138.4 ohm = 100°C.

The function between temperature (T) and resistance (R) is approximately linear over a small temperature range: for example, if you assume that it is linear over the 0° to 100°C range, the error at 50°C is 0.4°C.

For precision measurement, it is necessary to linearise the resistance to give an accurate temperature. The most recent definition of the function between resistance and temperature is International Temperature Standard 90 (ITS-90). The function between resistance and temperature, obtained in laboratory tests, measuring directly the resistance value on the contacts is shown in the graph.

We suggest, anyway, to set the system in order to compensate both heat dissipation and cable resistance.

A 1°C temperature change will cause a 0.384 ohm change in resistance, so even a small error in measurement of the resistance (for example, the resistance of the wires leading to the sensor) can cause a large error in the measurement of the temperature.

Because of the low signal levels, it is important to keep any cables away from electric cables, motors, switchgear and other devices that may emit magnetic or electrical noise. Using screened cable, with the screen grounded at one end, may help to reduce interference.

When using long cables, it is necessary to check that the measuring equipment is able to handle the cable resistance.

For a correct assembly see Warnings (on page 1777).

SWIVELLING CONNECTOR
With built-in cable gland and contact holder. Front or axial output (high or low) ensuring protection against water sprays (protection class IP 65 according to table EN 60529 table on page A23).

CONTRAST SCREEN
White lacquered aluminium. The housing, in the appropriate external rear slot, guarantees the best protection from direct contact with fluid. It can be taken out from the inclined side, before assembly to allow the insertion of level lines or words.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
90°C (with oil).

FEATURES AND PERFORMANCES
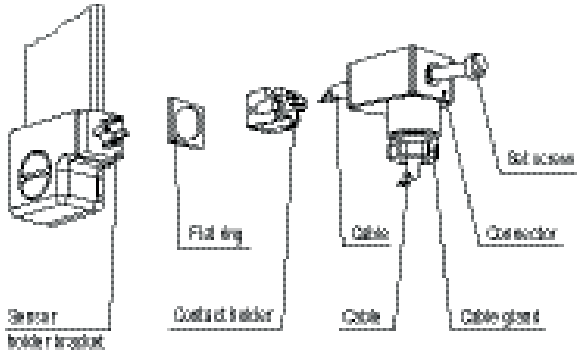
In addition to the visual control, HCV-STL column level indicator generates an analogue electric signal of oil temperature.
Ultrasound welding to guarantee a perfect seal.
Maximum fluid level visibility even from side positions.
Lens effect for a better visibility of the fluid level.

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the weld stood up to: 18 bar (HCV.127) 12 bar (HCV.254).
For use with other fluids and under different pressure and temperature conditions, please contact ELESA Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.

SPECIAL EXECUTIONS ON REQUEST
- Level indicators with stainless steel screws, nuts and washers.
- Level indicators for use with fluids containing alcohol.
- UV resistant transparent technopolymer level indicators.

ELESA Original design

CONNECTOR ASSEMBLY INSTRUCTIONS
1. Remove the connector from the indicator by unscrewing the set screw placed on the connector, take the contact holders out and loosen the cable gland.
2. Slip on the cable into the connector (standard connector) and connect the wires to the terminals 3 and earth of the contact holder.
3. Assemble by pressing the contact holder into the connector in the required position.
4. Screw the connectors to the indicator and then tighten the cable glands.



FUNCTIONING OF THE TEMPERATURE ELECTRICAL PROBE

The working principle of the temperature probe is to measure the variation of resistance of a platinum element: 100 ohm = 0°C, 138.4 ohm = 100°C.

The function between temperature (T) and resistance (R) is approximately linear over a small temperature range: for example, if you assume that it is linear over the 0° to 100°C range, the error at 50°C is 0.4°C.

For precision measurement, it is necessary to linearise the resistance to give an accurate temperature. The most recent definition of the function between resistance and temperature is International Temperature Standard 90 (ITS-90). The function between resistance and temperature, obtained in laboratory tests, measuring directly the resistance value on the contacts is shown in the graph. We suggest, anyway, to set the system in order to compensate both heat dissipation and cable resistance.

A 1°C temperature change will cause a 0.384 ohm change in resistance, so even a small error in measurement of the resistance (for example, the resistance of the wires leading to the sensor) can cause a large error in the measurement of the temperature.

Because of the low signal levels, it is important to keep any cables away from electric cables, motors, switchgear and other devices that may emit magnetic or electrical noise. Using screened cable, with the screen grounded at one end, may help to reduce interference.

When using long cables, it is necessary to check that the measuring equipment is able to handle the cable resistance.

Column level indicators

with MIN level and MAX temperature electrical sensors, technopolymer

MATERIAL
Transparent polyamide based (PA-T) technopolymer. Highly resistant to shocks, solvents, oils with additives, aliphatic and aromatic hydrocarbons, petrol, naphtha, phosphoric esters.
Avoid contact with alcohol or detergents containing alcohol.

SCREWS
Nickel-plated brass with hexagon socket.

PACKING RINGS
NBR synthetic rubber O-Ring.

FLOAT
Polyamide based (PA) technopolymer in red colour, with a built-in magnetic element to activate the electric contact when the oil level drops to the minimum set at 40mm over the screw axis (dimension I).

MIN LEVEL ELECTRICAL SENSOR
It generates an electric signal when the oil level reaches the minimum level.
The inside of the cavity where the sensor is contained is completely resinated in order to increase the thermal and electric insulation.

CONNECTOR
Right side output including protection against water sprays (protection class IP 65 according to EN 60529 on page A23).

MAX TEMPERATURE ELECTRICAL SENSOR (80°C)
It is set at a standard intervention temperature of 80°C, placed close to a metallic plate which serves as a conductor of the heat of the fluid for a faster transmission and a lower dissipation. The inside of the cavity where the sensor is contained is completely resinated in order to increase the thermal and electric insulation.
For a correct assembly see Warnings (on page 1777).

CONTRAST SCREEN
White lacquered aluminium. The housing, in the appropriate external rear slot, guarantees the best protection from direct contact with fluid.
It can be taken out before assembly to allow the insertion of level lines or words.

SCREW-COVERS
Polyamide based technopolymer, grey colour.

STANDARD EXECUTIONS
- **HCY-E-ST-NO**: with electrical contact normally open.
- **HCY-E-ST-NC**: with electrical contact normally closed.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
80°C (with oil).

TECHNICAL DATA
In laboratory tests carried out with mineral oil type CB68 (according to ISO 3498) at 23°C for a limited period of time, the weld stood up to: 14 bar (HCY.76), 9 bar (HCY.127) and 8 bar (HCY.254).
For use with other fluids and under different pressure and temperature conditions, please contact ELESA Technical Department.
In any case we suggest to verify the suitability of the product under the actual working conditions.

SPECIAL EXECUTIONS ON REQUEST
- Column level indicators in different materials (polycarbonate), for use with special fluids and/or at high temperatures.
- AISI 316 stainless steel or nickel-plated brass screws
- Column level indicators with change-over electrical contact.
- Execution with PT100 temperature electrical probe for connection to PLC.
- Electrical sensors set at the following temperatures: 50°, 60°, 70°C.

TWO-PIN CONNECTOR ASSEMBLY INSTRUCTIONS
1. Remove the connector from the indicator by unscrewing the set screw placed in the bottom, take the contact holder out and loosen the cable gland.
2. Slip on the two-pole cable into the connector (standard connector) and connect the wires to the terminals nr. 1 and nr. 2 of the contact holder.
3. Assemble by pressing the contact holder into the connector in the required position.
4. Screw the connectors to the indicator and then tighten the cable glands.

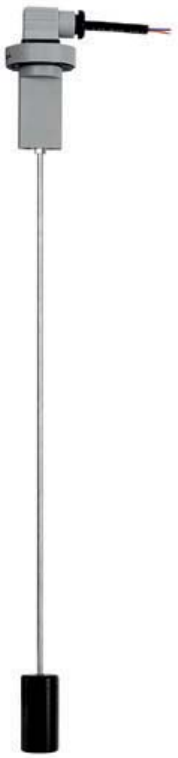
Rapid levels with float

Technopolymer



MATERIAL
Polyamide-based (PA) technopolymer, grey colour.

PACKING RINGS
- TPE flat gasket (HFL-EF).
- NBR synthetic rubber O-Ring (HFL-ER).

CONNECTOR WITH SENSOR BLOCK
Right side output including protection against water sprays (protection class IP 65 according to EN 60529 table on page A23).
For a correct assembly see Warnings (on page 1777).

DIPSTICK
AISI 304 stainless steel tube, fastened to the body by a nickel-plated brass coupler.

FLOAT
NBR synthetic rubber.

STANDARD EXECUTIONS
- **HFL-EF**: assembly by means of a flange with 3 holes at 120° for 3 zinc-plated steel screws with hexagon socket, supplied. It can be assembled also with 2 holes at 180°.
- **HFL-ER**: assembly by means of a 1" Gas threaded coupler.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
80°C.

FEATURES AND APPLICATIONS
HFL-E rapid levels show a minimum or maximum default level, according to the application needs.
Highly versatile, these rapid levels allow to define the most accurate set point by simply disassembling the dipstick float and cutting the dipstick exactly where needed, according to the specifications shown in the table.
Free from magnetic parts, the float is integral to the dipstick making this level indicator ideal for use in tanks containing dirty liquids, water, oil, coolant oil, also with iron metal parts or foams. Moreover, the operation is independent of the fluid electrical conductivity.
To ensure utmost safety, the electrical components are separated from the tank and perfectly sealed by means of ultrasound welding.

SPECIAL EXECUTIONS ON REQUEST
- Level indicators in different materials for use with particularly aggressive fluids and/or maximum working temperature up to 120°C.
- Dipsticks in different lengths and/or in AISI 316 stainless steel.
- Float with through holes to allow positioning according to different needs, avoiding cutting the dipstick.
- Double dipstick and double float manufactured for double minimum and maximum level reading.

Rapid levels with float

Technopolymer

MATERIAL
Body, dipstick and float: polyamide based (PA) technopolymer, grey colour.

PACKING RINGS
- TPE flat gasket (HFLT-EF).
- NBR synthetic rubber O-Ring (HFLT-ER).

CONNECTOR
EN 175301-803 (A and C shape) / ISO 4400

DIPSTICK
Featuring two raised scales (for floatation in oil or water)

STANDARD EXECUTIONS
- **HFLT-EF**: assembly by means of a flange with 3 holes at 120° for 3 zinc-plated steel screws with hexagon socket, supplied, and a threaded coupler.
- **HFLT-ER**: assembly by mans of a 1" Gas threaded coupler.

MAXIMUM CONTINUOUS WORKING TEMPERATURE
80° C.

FEATURES AND APPLICATIONS
HFLT-E rapid levels detects a predefined minimum or maximum level, according to the application needs.
Highly versatile, these rapid levels allow to define both the most accurate set point required by simply disassembling the dipstick float and cutting the dipstick exactly where needed, and the kind of operation required, with normally open (NO) or normally closed (NC) contact in presence of liquid, by loosening the fastening nut on the opposite end of the dipstick and positioning the inner magnet according to specific requirements (refer to the adhesive label).
The magnet is generally supplied with normally open (NO) contact in presence of liquid.
Free from magnetic parts, the float is integral to the dipstick making this level indicator ideal for use in tanks containing dirty liquids, water, oil, coolant oil, also with iron metal parts or foams. Moreover, the operation is independent of the fluid electrical conductivity.
To ensure utmost safety, the electrical components are separated from the tank and perfectly sealed by means of ultrasound welding.

SPECIAL EXECUTIONS ON REQUEST
- Polypropylene body (PP).
- With flange with 6 holes for fastening with cylindrical head screws (supplied), in addition to the threaded body.
- For use with maximum working temperature up to 120°C.

TWO-PIN CONNECTOR ASSEMBLY INSTRUCTIONS
1. Remove the connectors from the indicator by unscrewing the set screw placed in the bottom, take the contact holders out and loosen the cable glands.
2. Slip on the two-pole cable into the connectors (standard connectors) and connect the wires to the terminals nr. 1 and nr. 2 of the relative contact holders.
3. Assemble by pressing the contact holders into the realtive connectors in the required position.
4. Screw the connectors to the indicator and then tighten the cable glands.

16 Tube clamp connectors

Tube clamp connectors

Linear actuators

Clamp mountings

Tube clamp connectors

Tube clamp connectors are clamping components made of **aluminum** or **Stainless Steel** which offer the facility for simply and rapidly constructing jigs, fixtures and operating systems using standard round and square section tubings.

The vast range of clamp connectors in split monoblock or multi-part form offer almost unlimited possibilities.

Split monoblock clamp connectors give very robust and sturdy tubular constructions. For this purpose only precision tubings DIN 2391, with an outside diameter which lies within relatively tight tolerances, should be used.
(Construction tubes GN 990 see page 1902).

Multi-part clamp connectors (consisting of two or more separate parts) are not tied to tight tolerances as they can be used with square tubes (Construction tubes GN 990 see page 1902) thus allowing incorporation into already existing systems.

As clamping screws there is a choice of either cap head screws to DIN 912 or adjustable clamping kits GN 911 if repeated removal and re-installation is required. As for nuts, hexagon nuts DIN 985 (ISO 10511) which are self-locking with polyamide ring are recommended.

The clamping points are provided on **both sides** with sockets, cast in the component, which give a free choice for positioning hexagon nuts and clamping connectors.

Within the tube clamp connectors range there are numerous clamping components available...

The tube clamp connector program offers a wide range of components that can be used in connection with **linear actuators** (tubes with adjustable spindle) see page 1910 and following pages.

INFORMATION

The clamping bores of GN 132.5 Stainless Steel-Two-way connector clamps are mechanically machined and designed for construction tubings GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The shape of the clamping screws / nuts prevents the formation of wetness due to dammed-up water. The designs with sealing (Type B) also seals bore holes and threads.

INFORMATION

The clamping bores of GN 135 two-way connector clamps are not machined and specially designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The square designs are also suitable for use in **profile systems**.
The bore holes and squares must be put together such that an adaptation between between different tube cross-sections is possible.
The standard clamping screws are socket cap screws DIN 912. They can be replaced by adjustable clamping kits GN 911 (see page 1874) (article code see table of dimensions).

Socket cap screw DIN 912
Stainless Steel AISI 304

Hexagon nuts DIN 985
Stainless Steel AISI 304

INFORMATION

The clamping bores of GN 133 two-way connector clamps are mechanically machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The standard version of the clamping screws are socket cap screws with hexagonal socket DIN 912. They can be replaced by clamping kits GN 911 (see page 1874) (article code see table of dimensions).

INFORMATION

The clamping bores of the flanged two-way connector clamps GN 134 are not machined and specially designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The square designs are also suitable for use in **profile systems**.
Bores and square bores of the same nominal size can be assembled in any combination. For instance, nominal size 20 has the following combination options: B20-B20, B20-V20, V20-B20 and V20-V20.
The standard clamping screws are socket cap screws DIN 912. They can be replaced by adjustable clamping kits GN 911 (see page 1874) (article code see table of dimensions).

INFORMATION

The clamping bores of GN 145 flanged connector clamps are mechanically machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
GN 145 flanged connector clamps are also suitable for mounting on **profile systems**.
The standard version of the clamping screw is a socket cap screw with hexagonal socket DIN 912. It can be replaced by a clamping kits GN 911 (see page 1874) / GN 911.3 (see page 1875) (article code see table of dimensions).

ACCESSORY

- Clamping kits GN 911 (see page 1874) / GN 911.3 (see page 1875) (article code see table of dimensions).

GN 162.3

Base plate connector clamps

Aluminium / Stainless Steel, with 2 mounting holes

SPECIFICATION

Identification No.

No. **2**: with Stainless Steel-Clamping screw DIN 912

Version in Aluminium

plastic coated
black, RAL 9005, textured finish **SW**

blank
matt shot-blasted **BL**

Version in Stainless Steel NI

AISI CF-8
matt shot-blasted

Clamping bores mechanically machined

Socket cap screws DIN 912
Stainless Steel AISI 304

Hexagon nuts DIN 985
Stainless Steel AISI 304

INFORMATION

The clamping bore of the base plate connector clamps GN 162.3 is mechanically machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
GN 162.3 base plate connector clamps are also suitable for mounting on **profile systems**.
The standard version of the clamping screw is a socket cap screw with hexagonal socket DIN 912. It can be replaced by a clamping kits GN 911 (see page 1874) / GN 911.3 (see page 1875) (article code see table of dimensions).

ACCESSORY

- Clamping kits GN 911 (see page 1874) / GN 911.3 (see page 1875)

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

SPECIFICATION

Types

- Type **A**: without sealing
- Type **B**: with sealing

Stainless Steel

- AISI CF-8
- matt shot-blasted

Clamping bores
mechanically machined

Carriage bolt DIN 603
Stainless Steel A2

Cap nuts DIN 917
Stainless Steel A2

Sealings

Washers
Plastic (Polyacetal POM)

Edge ring
Silicon, 40 ... 60 Shore A

INFORMATION

The clamping bores of the Stainless Steel-Base plate connector clamps GN 163.5 are mechanically machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The shape of the clamping screws / nuts prevents the formation of wetness due to dammed-up water. The designs with sealing (Type B) also seals bore holes and threads.

T-Angle connector clamps

Aluminium / multi part assembly

SPECIFICATION

Identification No.

No. **2**: with 6 Stainless Steel-Clamping screws DIN 912

Aluminium

plastic coated
black, RAL 9005, textured finish **SW**

blank **BL**
matt shot-blasted

Clamping bores not machined

Socket cap screws DIN 912
Stainless Steel AISI 304

Hexagon nuts DIN 985
Stainless Steel AISI 304

INFORMATION

The clamping bores of the T-Angle connector clamps GN 195 are not machined and specially designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively. The square designs are also suitable for use in **profile systems**. The standard clamping screws are socket cap screws DIN 912. They can be replaced by adjustable clamping kits GN 911 (see page 1874) (article code see table of dimensions).

Stainless Steel-T-Angle connector clamps

SPECIFICATION

Types

- Type **A**: without sealing
- Type **B**: with sealing

Stainless Steel

- AISI CF-8
- matt shot-blasted

Clamping bores mechanically machined

Carriage bolt DIN 603
Stainless Steel A2

Cap nuts DIN 917
Stainless Steel A2

Sealings

Washers
Plastic (Polyacetal POM)

Edge ring
Silicon, 40 ... 60 Shore A

INFORMATION

The clamping bores of the Stainless Steel-T-Angle connector clamps GN 192.5 are mechanically machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The shape of the clamping screws / nuts prevents the formation of wetness due to dammed-up water. The designs with sealing (Type B) also seals bore holes and threads.

INFORMATION

The clamping bores of the T-Angle connector clamps GN 193 are not machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively. The versions with square bores are also suitable for **profile systems**. Bores and square bores of the same nominal size can be assembled in any combination. For instance, nominal size 20 has the following combination options: B20-B20, B20-V20, V20-B20 and V20-V20. The standard version of the clamping screw is a socket cap screw with hexagonal socket DIN 912. It can be replaced by a clamping kit GN 911 (see page 1874) (article code see table of dimensions).

Stainless Steel AISI 304

INFORMATION

The clamping bores of the T-Angle connector clamps GN 194 are not machined and designed for construction tubings GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively. The versions with square bores are also suitable for **profile systems**. Bores and square bores of the same nominal size can be assembled in any combination. For instance, nominal size 20 has the following combination options: B20-B20, B20-V20, V20-B20 and V20-V20. The standard clamping screws are socket cap screws DIN 912. They can be replaced by adjustable clamping kits GN 911 (see page 1874) (article code see table of dimensions).

Stainless Steel AISI 304

INFORMATION

The clamping bores of the Angle connector clamps GN 196 are specially designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The standard clamping screws are socket cap screws DIN 912. They can be replaced by adjustable clamping kits GN 911 (see page 1874) (article code see table of dimensions).

ACCESSORY

- Clamping kits GN 911 (see page 1874)

ON REQUEST

- d_1 / d_2 with different bores

Clamping bores mechanically machined

Socket cap screw DIN 912
Stainless Steel AISI 304

Hexagon nuts DIN 985
Stainless Steel AISI 304

INFORMATION

The clamping bores of GN 242 tube connector joints are mechanically machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The standard version of the clamping screws are socket cap screws with hexagonal socket DIN 912. They can be replaced by clamping kits GN 911 (see page 1874) (article code see table of dimensions).

ACCESSORY

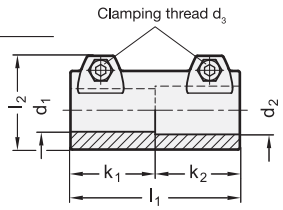
- Clamping kits GN 911 (see page 1874)

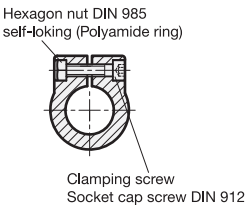
ON REQUEST

- d_1 / d_2 with different bores

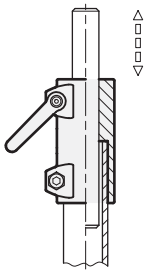
TECHNICAL INFORMATION

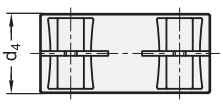
- Stainless Steel characteristics (see page A26)

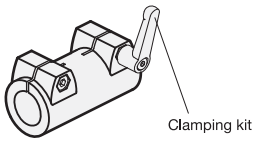




Application example







* Complete with colour index of the Tube connector joints (SW or BL)

INFORMATION

Swivel clamp connector bases GN 271 can be assembled with the swivel clamp connectors GN 273 (see page 1849), GN 275 (see page 1854) or GN 277 (see page 1855) to create swivel clamp connector joints.
GN 271 swivel clamp connector bases are also suitable for mountings on **profile systems**.

Stainless Steel AISI 304

INFORMATION

The clamping bore of GN 275 swivel clamp connectors is mechanically machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The standard version of the clamping screw is a socket cap screw with hexagonal socket DIN 912. It can be replaced by a clamping kit GN 911 (see page 1874) (article code see table of dimensions).
GN 275 swivel clamp connectors can be assembled with swivel clamp connectors GN 271 (see page 1847), GN 273 (see page 1849) or GN 277 (see page 1855) to create swivel clamp connector joints.

INFORMATION

The clamping bore of GN 279 swivel clamp connectors is not machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The square designs are also suitable for use in **profile systems**.
The standard version of the clamping screws are socket cap screws with hexagonal socket DIN 912. They can be replaced by clamping kits GN 911 (see page 1874) (article code see table of dimensions).
Two GN 279 swivel clamp connectors can be combined to GN 289 (see page 1870) swivel clamp connector joints.
GN 279 swivel clamp connectors can be assembled with swivel clamp connectors GN 272 (see page 1848), GN 274 (see page 1850) or GN 276 (see page 1852) to create swivel clamp connector joints.

INFORMATION

GN 281 swivel clamp connector joints are an assembly of the swivel clamp connectors GN 271 (see page 1847) and GN 275 (see page 1854).
The clamping bore is mechanically machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The standard version of the clamping screws are socket cap screws with hexagonal socket DIN 912. They can be replaced by adjustable clamping levers GN 911 (see page 1874) (see table of dimensions).

GN 282

Swivel clamp connector joints

Aluminium

SPECIFICATION

Identification No.

No. **2**: with 2 Stainless Steel-clamping screws DIN 912

Types

- Type **S**: stepless adjustment
- Type **T**: adjustment by 15°- division (serration)

Aluminium

plastic coated
black RAL 9005, textured finish **SW**

blank **BL**
matt shot-blasted

Clamping bore mechanically machined

Socket cap screws DIN 912
Stainless Steel AISI 304

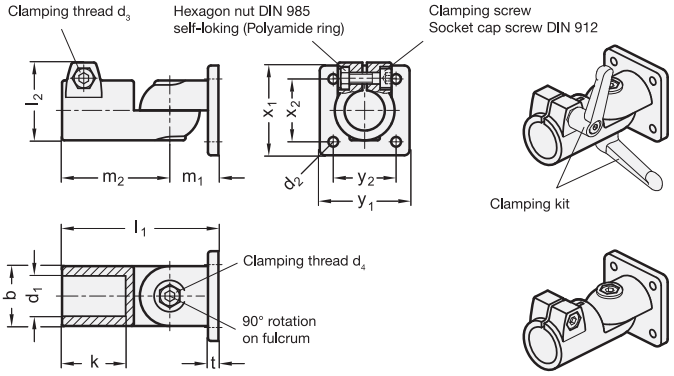
Hexagon nuts DIN 985
Stainless Steel AISI 304

INFORMATION

The swivel clamp connector joints GN 282 are an assembly of of the swivel clamp connectors GN 272 (see page 1848) and GN 276 (see page 1852).
For the type with stepless adjustment (Type S) swivel clamp connectors with a centring step are used.
The clamping bore is mechanically machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The standard clamping screws are socket cap screws DIN 912. They can be replaced by clamping kits GN 911 (see page 1874) (article code see table of dimensions).

ACCESSORY

- Clamping kits GN 911 (see page 1874)



*Complete with colour index of the Swivel clamp connector joints (SW or BL)

INFORMATION

GN 284 swivel clamp connector joints are an assembly of the swivel clamp connectors GN 274 (see page 1850) and GN 276 (see page 1852). For the type with stepless adjustment (Type S) swivel clamp connectors with a centring step are used. Within the identical swivel width "b", all bores „d_1 / d_2" can be combined as required.
The clamping bore is mechanically machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively. The standard version of the clamping screws are socket cap screws with hexagonal socket DIN 912. They can be replaced by adjustable clamping levers GN 911 (see page 1874) (see table of dimensions).

Weight BL

Swivel clamp connector joints

Aluminium

SPECIFICATION

Identification No.

No. **2**: with 3 Stainless Steel-Clamping screws DIN 912

Types

- Type **S**: stepless adjustment
- Type **T**: adjustment by 15°-division (serration)

Aluminium

plastic coated
black RAL 9005, textured finish **SW**

blank **BL**
matt shot-blasted

Clamping bores mechanically machined

Socket cap screws DIN 912
Stainless Steel AISI 304

Hexagon nuts DIN 985
Stainless Steel AISI 304

INFORMATION

GN 286 swivel clamp connector joints are an assembly of two GN 276 (see page 1852) swivel clamp connectors.
For the type with stepless adjustment (Type S) swivel clamp connectors with a centring step are used. Within the identical swivel width „b", all bores „d_1/ d_2" can be combined as required. The clamping bore is mechanically machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The standard version of the clamping screws are socket cap screws with hexagonal socket DIN 912. They can be replaced by adjustable clamping levers GN 911 (see page 1874) (see table of dimensions).

ACCESSORY

- Clamping kits GN 911 (see page 1874)

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

Swivel clamp connector joints

Aluminium

SPECIFICATION

Identification No.

No. **2**: with 3 Stainless Steel-Clamping screws DIN 912

Types

- Type **S**: stepless adjustment
- Type **T**: adjustment by 15°-division (serration)

Aluminium

plastic coated
black RAL 9005, textured finish **SW**

blank **BL**
matt shot-blasted

Clamping bores mechanically machined

Socket cap screws DIN 912
Stainless Steel AISI 304

Hexagon nuts DIN 985
Stainless Steel AISI 304

INFORMATION

GN 288 swivel clamp connector joints are an assembly of swivel clamp connectors GN 276 (see page 1852) and GN 278 (see page 1856) to create swivel clamp connector joints.
For the type with stepless adjustment (Type S) swivel clamp connectors with a centring step are used. Within the identical swivel width "b", all bores "d_1/d_2" can be combined as required. The clamping bores are mechanically machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The standard version of the clamping screws are socket cap screws with hexagonal socket DIN 912. They can be replaced by adjustable clamping lever GN 911 (see page 1874) (see table of dimensions).

ACCESSORY

- Clamping kits GN 911 (see page 1874)

Weight BL

Swivel clamp connector joints

Aluminium / with two-part clamp pieces

SPECIFICATION

Identification No.

No. **2**: with 5 Stainless Steel-Clamping screws DIN 912

Type

Type **S**: stepless adjustment

Aluminium

plastic coated
black RAL 9005, textured finish **SW**

blank **BL**
matt shot-blasted

Clamping bores not machined

Socket cap screws DIN 912
Stainless Steel AISI 304

Hexagon nuts DIN 985
Stainless Steel AISI 304

INFORMATION

GN 289 swivel clamp connector joints are an assembly of two GN 279 (see page 1858) swivel clamp connectors.
The clamping bores of the swivel clamp connector joints GN 289 are not machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The swivel clamp connectors have an identical swivel width "b", so that all bores „d1/s1" and „d2/s2" can be combined as required.
The standard version of the clamping screws are socket cap screws with hexagonal socket DIN 912. They can be replaced by adjustable clamping levers GN 911 (see page 1874) (see table of dimensions).

ACCESSORY

- Clamping kits GN 911 (see page 1874)

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

Clamping bore mechanically machined

Socket cap screw DIN 912
Stainless Steel AISI 304

Hexagon nuts DIN 985
Stainless Steel AISI 304

INFORMATION

The clamping bore of the sensor holders GN 273.4 is mechanically machined and designed for construction tubes GN 990 (see page 1902) or DIN 2391, DIN 2395 and DIN 2462 respectively.
The standard version of the clamping screws are socket cap screws with hexagonal socket DIN 912. They can be replaced by adjustable clamping levers GN 911 (see page 1874) (see table of dimensions).
The Aluminium design guarantees a highly safe and secure clamping action and safe positioning.

ACCESSORY

Clamp mountings

Range

With clamp mountings, tubes and rods can be fixed with better clamping pressure with minimum space requirement.
Standardized hole spacings and thread dimensions make the replacement of mounting clamps very simple and efficient during assembly.
In particular, swivel clamp mountings can be combined to jointed clamp mountings.

The aluminum-alloy used for the clamp mountings has excellent strength and good chemical resistance. The version with a black anodized surface is additionally protected against corrosion. Technopolymer bases and clamps are lightweight and resistant to solvents, oils, greases and other chemical agents. The special knurling on the tube of MSR. prevents the risk of free rotation of the tube itself. Together with fastening and clamping screws made from corrosion resistant A2 stainless steel the use under unfavorable ambient conditions is possible.

Accessories such as sensor plates, retaining rods and tubes as well as clamping kits complete the range. If required, a suitable retaining magnet (GN 51.6 see page 2032) is available to facilitate rapid repositioning.
Positioning of sensors, scanners, reflectors, cameras, coolant pipes and air nozzles is a typical practical application.

Base plate clamp mountings

Aluminium

SPECIFICATION

Aluminium

- matt, slide ground **MT**
- anodized, black **ELS**

Socket cap screws DIN 912
Stainless Steel AISI 304

INFORMATION

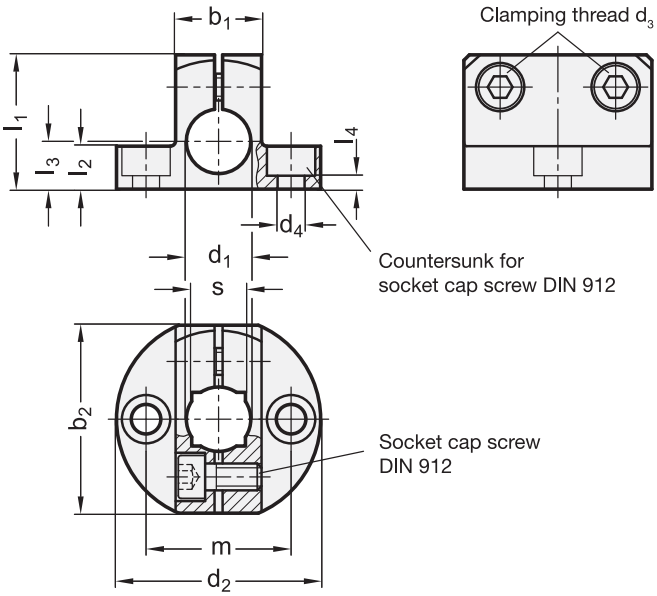
The base plate clamp mountings GN 473 have a horizontal and a vertical clamping bore. The vertical clamping bore is additionally fitted with a square.
The bore distance m of the base plate mountings GN 473 is matched with the clamp mountings GN 477 (see page 1879) and the flanged bolts GN 480 (see page 1885) as well as retaining magnets GN 51.6 (see page 2032).
The standard version of the clamping screw is a socket cap screw with hexagonal socket DIN 912. It can be replaced by an adjustable clamping kits GN 511 (see page 1893) (see table of dimensions).

TECHNICAL INFORMATION

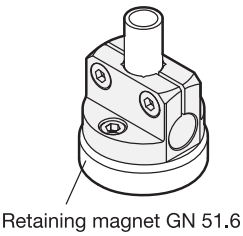
- Stainless Steel characteristics (see page A26)

ACCESSORY

- Clamping kits GN 511 (see page 1893)



Application example



* Complete with Finish of the Base plate clamp mountings (MT or ELS)

MT matt, slide ground
ELS anodized, black

Socket cap screws DIN 912
Stainless Steel AISI 304

Grub screw DIN 915
Stainless Steel AISI 304

Clamping kits GN 511 (see page 1893)

INFORMATION

Twistable two-way clamp mountings GN 475 connect rods and tubes within the clamp mounting system under any adjustable angle. With the angle adjustment released, the clamp mounting halves stay connected with formlocking effect.
The standard version of the clamping screws at the clamping threads d_3 and d_4 are socket cap screws with hexagonal socket DIN 912. They can be replaced by an adjustable clamping lever GN 511 (see page 1893).

- Inserts / Distance bushings, Stainless Steel AISI 303

INFORMATION

Attachment clamp mountings GN 478 are primarily designed for mounting sensor holders GN 479 (see page 1895) and retaining plates GN 479.1 (see page 1896). They are fitted with a central thread and with d_1 = B15 bore and higher, an additional bore template 4 x M4. The standard clamping screw is a socket cap screw with hexagonal socket DIN 912. It can be replaced by an clamping kit GN 511 (see page 1893) (see table of dimensions).

GN 480

Flanged bolts

for clamp mountings

SPECIFICATION

Steel zinc plated, blue passivated

INFORMATION

GN 480 Flanged bolts are used in connection with clamp mountings, as foot or as connecting element, e.g. for adjustments in width or height.
With their low flange height, they provide an alternative for the foot clamp mounting GN 473 (see page 1878) in applications where clamping is required at low height above the clamping surface.
The bore distance m of the flanged bolts GN 480 is matched with the clamp mountings GN 473 (see page 1878) and GN 477 (see page 1879) as well as with retaining magnets GN 51.6 (see page 2032).

GN 485

Swivel clamp connector bases

Aluminium

SPECIFICATION

Aluminium

- matt, tumbled finish **MT**
- anodized, black **ELS**

INFORMATION

Swivel clamp connector bases GN 485 can be combined with swivel clamp mountings GN 482 (see page 1890), T-swivel clamp mountings GN 483 (see page 1891) and attachment clamp mountings GN 484 (see page 1892) with the same k dimensions into swivel clamp mounting joints. Clamping kits GN 511.1 (see page 1894) with screw (type S) and adjustable hand lever (type K) are available to connect the joints and bases (code no. for ordering is shown in the dimensional table).
The center to center mounting hole distance m of the swivel clamp connector bases GN 485 matches the base plate clamp mountings GN 473 (see page 1878), clamp mountings GN 477 (see page 1879), flanged bolts GN 480 (see page 1885) as well as retaining magnets GN 51.6 (see page 2032).

Stainless Steel-Hose adapters

Barbed fitting / Thread

SPECIFICATION

Stainless Steel

- AISI 304
- blank, unfinished

INFORMATION

GN 480.7 hose adapters can attach e.g. air nozzles or coolant nozzles and their feed pipes with clamp mountings and hold them in position. The d_2 / d_3 thread and barbed fitting diameters are compatible with the most common bolt and internal hose diameters. Hose lines are attached to the barbed fitting with suitable hose clamps, securing them against slipping off.

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

Cylinder head screws DIN 912
Stainless Steel AISI 304

INFORMATION

Swivel clamp mountings GN 482 can be combined with T-Swivel clamp mountings GN 483 (see page 1891) and attachment clamp mountings GN 484 (see page 1892)with the same k dimensions into swivel clamp mounting joints. Clamping kits GN 511.1 (see page 1894) with screw (type S) and adjustable hand lever (type K) are available for this combination.
Also, the clamping screw d_4 which is a cylinder head screw with DIN 912 hexagonal recess in the standard design - can be replaced by a clamping kit GN 511 (see page 1893).
The description for ordering is shown in the dimensional table.

Attachment clamp mountings

Aluminium

SPECIFICATION

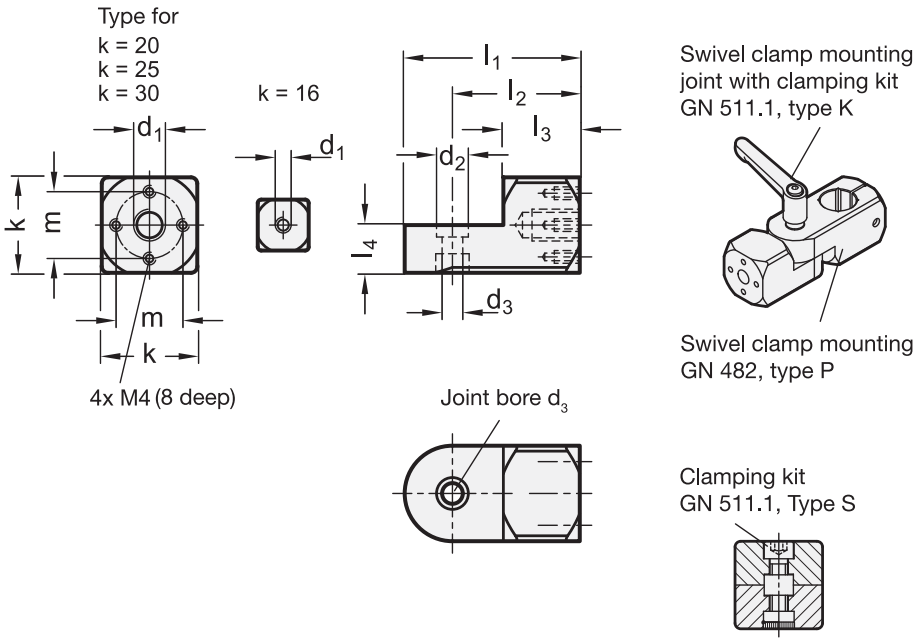
Aluminium

- matt, slide ground **MT**
- anodized black **ELS**

INFORMATION

Attachment clamp mountings GN 484 are primarily designed for mounting sensor holders GN 479 (see page 1895) and retaining plate GN 479.1 (see page 1896). They are fitted with a central thread and for the size with k = 20 and higher, an additional bore template 4 x M4.

Using swivel clamp mountings GN 482 (see page 1890) and T-Swivel clamp mountings GN 483 (see page 1891) with the same k dimensions, attachment clamp mountings GN 484 are easily combined into articulated swivel clamp mounting joints. Clamping kits GN 511.1 (see page 1894) with screw, type S and adjustable hand lever, type K are available for this purpose (description see table of dimensions).



*Complete with Finish of the Attachment clamp mountings (MT or ELS)

Clamping lever kits

adjustable, for clamp mountings

SPECIFICATION

Handle
Zinc die casting
plastic coated
silver, RAL 9006, textured finish

Insert / Distance bushing
Stainless Steel AISI 303

INFORMATION

For clamp mountings, the clamping kits GN 511 replace the hexagon socket screw DIN 912. It is used on all clamping points where repeated clamping actions are required, e.g. for adjusting a stop mechanism. The matching clamping kits for each clamping thread are listed in the dimensional tables of the clamp mountings.

Stainless Steel AISI 304

INFORMATION

With clamping kits GN 511.1 swivel clamp mountings GN 482 (see page 1890) can be combined with T-Swivel clamp mountings GN 483 (see page 1891) and attachment clamp mountings GN 484 (see page 1892) with the same k-dimensions into swivel clamp mounting joints.
The centering bush positions the swivel clamp mountings in relation to each other. During assembly, the knurled threaded bushing is inserted by the clamping screw itself and by pressing into one of the two swivel clamp mountings and so serves to clamp the articulated joint.
The matching clamping kits are shown in the dimensional tables of the appropriate swivel clamp mountings.

GN 479

Sensor holders

for clamp mountings with threaded holes GN 478 / GN 484

SPECIFICATION

Stainless Steel AISI 303
matt-shot blasted

INFORMATION

The sensor holders GN 479 are designed for holding sensors attached with two lock nuts.
The attachment bore matches the central thread of clamp mountings GN 478 (see page 1884) and attachment clamp mountings GN 484 (see page 1892) . For k=30, the cross-shaped slotted holes provide extra adjustability and allow the use of two fixing screws.
Fixing screws have to be ordered separately.

Retaining plates

for clamp mountings with threaded holes
GN 478 / GN 484

SPECIFICATION

Stainless Steel AISI 303
matt-shot blasted

INFORMATION

Retaining plates GN 479.1 are designed as universal mounting elements, e.g. for integrating specific hole patterns..
The attachment bore matches the central thread of clamp mountings GN 478 (see page 1884) and attachment clamp mountings GN 484 (see page 1892). For k=30, the cross-shaped slotted holes provide extra adjustability and allow the use of two fixing screws.
Fixing screws have to be ordered separately.

Angled pieces for profile systems 30 / 40 / 45

for slot widhts 8 / 10, assembly with T-Nuts / T-Slot bolts

SPECIFICATION

Types

- Type **A**: without assembly set, without cover
- Type **B**: with assembly set, with cover
- Type **C**: with assembly set, without cover

Aluminium
Die casting

matt shot-blasted **MT**

plastic coated
black, RAL 9005, textured finish **SW**
silver, RAL 9006, textured finish **SR**

T-Slot bolt GN 505.4 (see page 980)
with Hexagon flange nut DIN 6923
Steel
zinc plated, blue passivated

T-Nuts GN 505 (see page 979)
with Socket head cap screw DIN 7984
Steel
zinc plated, blue passivated

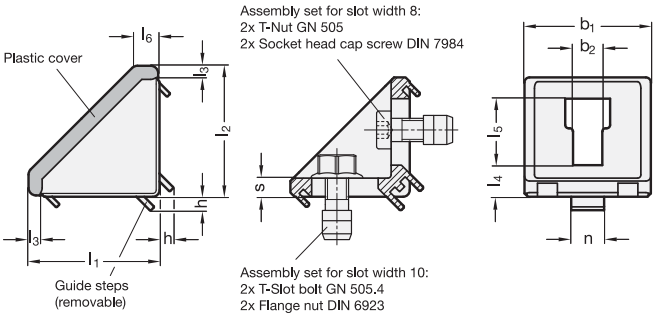
Cover
Plastic (Polyamide PA)
black, matt

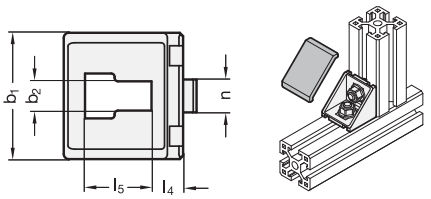
INFORMATION

To fix the angle pieces GN 960 in place, insert the assembly sets into the profile slot through the opening. When tightened, the nut or screw will be cross-positioned and so anchored in the slot.
For crossing profiles or when using the angle piece with elements without slot, the superfluous guide steps can be simply broken out.
After assembly, the cover caps are snapped into place via four lugs. They lend the angle piece an attractive appearance and protect against dirt.
Even after repeated use, the cover caps will remain firmly in place inside the angle pieces thanks to the elastic snap-type lugs. If required, these are also available individually under standard GN 963 (see page 1900).

TECHNICAL INFORMATION

- Plastic characteristics (see page A2)





* Complete with Finish of the Angle pieces for profile systems

Steel
zinc plated, blue passivated

Slotted fillister head screw ISO 7380
Steel
zinc plated, blue passivated

Cover
Plastic (Polyamide PA)
black, matt

INFORMATION

To fix the angle pieces GN 961 in place, first insert the nuts of the assembly set into the profile slot and fix the angle piece with the slotted fillister head screw. The guide step of the nut will then position these in parallel and centered to the slot; the spring element counteracts inadvertent sideways slip.
For crossing profiles or when using the angle piece with elements without slot, the superfluous guide steps can be simply broken out.
After assembly, the cover caps are snapped into place via four lugs. They lend the angle piece an attractive appearance and protect against dirt.
Even after repeated use, the cover caps will remain firmly in place inside the angle pieces thanks to the elastic snap-type lugs. If required, these are also available individually under standard GN 963 (see page 1900).

Angles for profile structures

Technopolymer

MATERIAL

Glass-fibre reinforced polyamide based (PA) technopolymer, grey colour similar to RAL 7046, matte finish.

STANDARD EXECUTIONS

- **SQT-A**: with two slots for M8 screws.
- **SQT-F**: with two holes for M8 screws and centering slides.
- **SQT-AF**: with slot and hole for M8 screws and centering slides. In case of assembly with the screws in the slots, we suggest you use screws type UNI 9327.

In case of assembly with the screws in the slots, we suggest you use screws type UNI 9327.

FEATURES AND APPLICATIONS

SQT. connecting angles are particularly suitable for the assembly, in a very easy way, of structures made out of aluminium profiles for safety protections of machines and equipment.
The shape, the sections and the material used guarantee high mechanical characteristics of rigidity, dimensional stability and high resistance to temperature.

TECHNICAL DATA

For the correct use, the stresses applied to the angles must satisfy the conditions indicated hereunder.

Cover caps

for angle pieces for profile systems

SPECIFICATION

Plastic (Polyamide PA)
black, RAL 9005, textured finish **SW**

INFORMATION

The cover caps GN 963 are suitable for use with angle pieces for profile systems GN 960 (see page 1897) and GN 961 (see page 1898). After assembly the angle pieces, the cover caps are snapped into place via four lugs. They lend the angle piece an attractive appearance and protect against dirt.
Even after repeated use, the cover caps will remain firmly in place inside the angle pieces thanks to the elastic snap-type lugs.

Construction tubes

Steel / Aluminium / Stainless Steel, for tube clamp connectors

SPECIFICATION

Version in Steel ST
zinc plated, blue passivated **ZB**

Version in Aluminium AL

- blank, untreated **BL**
- anodized, natural colour **EL**

Version in Stainless Steel AISI 304 NI

blank, untreated **BL**

Sawed cross sections deburred blank, i.e. not surface treated

INFORMATION

Construction tubes GN 990 can be supplied in any length up to 3000 mm.
The tolerances specified for the outside diameter of the round construction tubes comply with the requirements for split mono-block connector clamps. Otherwise the tolerances comply with DIN 2391, DIN 2395 and DIN 2462.
Two-piece connector clamps allow obviously larger tolerances on construction tubes.

TECHNICAL INFORMATION

GN 480.1

Retaining rods / Retaining tubes

Aluminium / Stainless Steel, for clamp mountings

SPECIFICATION

Types

- Type **OS**: without scale
- Type **LS**: with scale (mm-graduation)

Version in Stainless Steel NI
Retaining rods / tubes, round
Stainless Steel AISI 304
ground

Version in Aluminium AL
Retaining square tubes
Aluminium
anodized natural colour

Longitudinal scale engraved
in laser precision

INFORMATION

The outside dimensions of the retaining rods / retaining tubes GN 480.1 are matched for use with clamp mountings.
The retaining tubes can also be used as cable lead-through.

ON REQUEST

- Special scales

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

Connecting clamps

Technopolymer

FM design

STANDARD COMPONENTS

- **MSX-B base**: glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish. Fitting by means of a stainless steel M5 cylindrical-head screw with hexagon socket and nut.
- **MSX-C T-shaped clamp**: glass-fibre reinforced technopolymer, black colour, matte finish. Fitting by means of stainless steel M5 cylindrical-head screws with hexagon socket and nuts.
- **MSX-TA-TB-TC-TD-TE-TF device clamps**: glass-fibre reinforced technopolymer, black colour, matte finish. Fitting by means of a stainless steel M5 cylindrical-head screw with hexagon socket and nut.

FEATURES AND APPLICATIONS

The geometry of the holes of MSX. series connecting clamps are designed to fit both tubes with round cross section and tubes with square cross section; the latter prevents the elements from rotating (see Fig. 1).

ASSEMBLY INSTRUCTIONS

1. Assemble the base by means of 2 M6 cylindrical head screws with hexagon socket (not supplied).
2. Fit the connecting tube into the hole of the base and clamp it by screwing the set screw. Suggested tightening torque 5Nm.
3. Insert the connecting tube in the shaped hole of the two-way clamp.
4. Fit the other connecting tube into the hole of the two-way clamp.
5. Fit on the connecting tube the proper device clamp, chosen within the six available. After the positioning of the components, clamp them by screwing the set screws. Suggested tightening torque 5Nm.

Tests carried out with round tube.

Connecting clamps

Technopolymer and aluminium

FM design

STANDARD COMPONENTS

- **MSR.60-B base**: glass-fibre reinforced polyamide based (PA) technopolymer, black colour, matte finish.
- **CC-MSR.60 screw covers**:
  technopolymer in six colours, glossy finish.
  Supplied, push-fit assembly, removable by a screwdriver.
  Available also as accessories sold separately (see table CC-MSR).

Code	Description	Boss cap for
440011-*	CC-MSR.60-*	MSR.60-B

* Complete with colour index (C1, ..., C6).

- **MSR.60-C Two-way clamp**: glass-fibre reinforced technopolymer, black colour, matte finish.
- **MSR.60-TA-TB-TC-TD-TE-TF device clamps**: glass-fibre reinforced technopolymer, black colour, matte finish.
- **MSR.60-T13 connecting tubes**:
  aluminium profile available with standard lengths from 100 to 2000 mm.
  On request and for sufficient quantities other lengths are available.
- **Connecting tube closing caps**:
  glass-fibre reinforced technopolymer, black colour, matte finish.
  Supplied, push-fit assembly.
  To be ordered also separately (code 440016 description TC13-MSR.60).

FEATURES AND APPLICATIONS

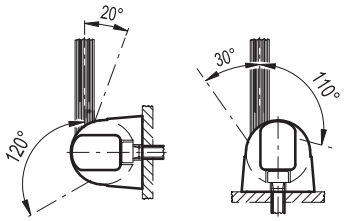
MSR. connecting clamps, designed according to ELESA patent, allow an easy and efficient connection between the components, preventing the risk of rotating freely.
The system allows the axial, perpendicular or angled positioning of the connecting tube to the base.

ADVANTAGES

The slot-shaped connecting tube preventing free rotation.
Tube and components clamped by the aid of only one screw.
Easy adjustments by five degrees of freedom of the clamped devices (see drawing).
Lack of cavities to avoid the deposit of dirt and undesired substances.
Easy identification of the clamped device using different coloured caps on the base.

ASSEMBLY INSTRUCTIONS

1. Assemble the base by means of 2 M6 cylindrical head screws with hexagon socket (not supplied).
2. Fit one of the closing caps to the end of the connecting tube by tapping gently with a plastic mallet until firmly in place. Be careful not to assemble the cap to the end fitted to the base.
3. Insert the connecting tube in the shaped hole of the base and clamp it by screwing the set screw. Suggested tightening torque 5 Nm.
4. Insert the connecting tube in the shaped hole of the two-way clamp.
5. Fit the closing caps to the connecting tube.
6. Insert the connecting tube in the shaped hole of the two-way clamp.
7. Fit on the connecting tube the proper device clamp, chosen within the six available. After the positioning of the components, clamp them by screwing the set screws. Suggested tightening torque 3 Nm. We recommend not to exceed this value.
8. Once the adjustment has been set, fit the screw covers on the base.



5 degrees of freedom

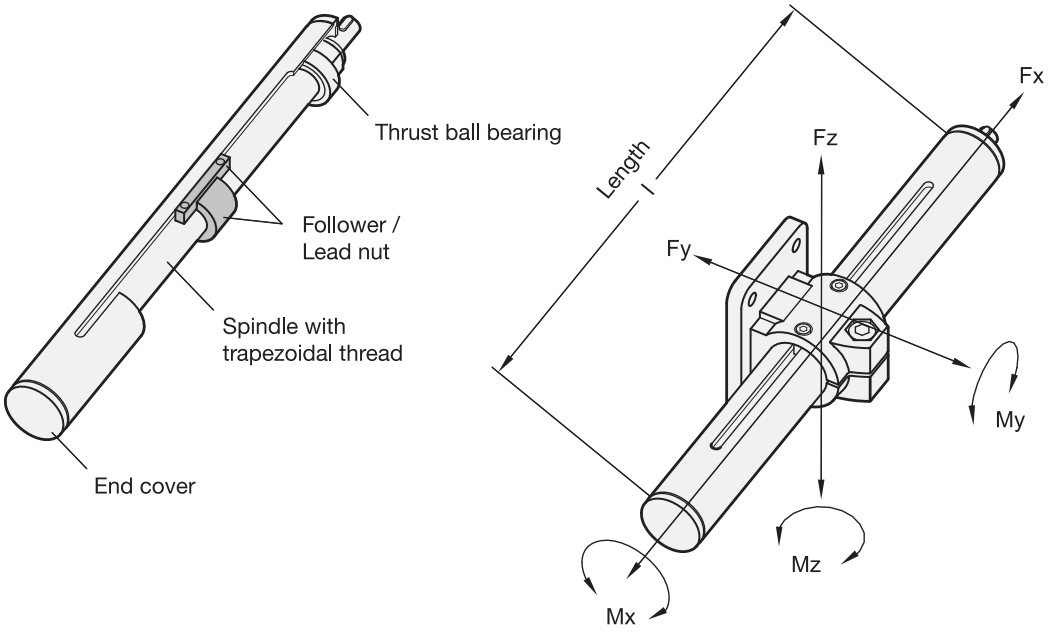
Linear actuators

Technical description



Ø Linear actuator	Fx in N	Fy in N l = 500	l = 1000	l = 1500	Fz in N l = 500	l = 1000	l = 1500	Mx in Nm	My in Nm	Mz in Nm
18	400	80	-	-	65	-	-	1.5	4.5	4.5
30	850	500	70	15	550	55	10	6.5	15	15
40	1100	2150	250	65	1900	150	50	15	42	42
50	1750	3100	650	150	3100	650	150	29	69	69
60	2600	4550	1500	400	4550	1400	350	45	125	125

The load data are applicable to linear actuators GN 291 (see page 1912), GN 292 (see page 1914), GN 293 (see page 1915) made of Steel (SCR) or Stainless Steel (NI).
The specified forces Fy and Fz cause a flexure of the guide tube of approx. 0.5 mm.

A lead nut moves in axial direction over the ball bearing trapezoidal thread spindle of the linear actuator. The follower ensures the anti-rotation and makes the link to the different linear actuator connectors. The linear actuators have been designed for manual operation (handwheel).

The positioning accuracy is 0.2 mm / 300 mm stroke, the maximum reverse play is 0.1 mm.

Guide tubes are available in chromed Steel (SCR) or Stainless Steel (NI) non-rusting. They are made with the tolerance range of precision steel tubes DIN 2391 or DIN 2462.

A wide variety of different components are available in the tube clamp connector program to fix the linear actuators in place and to upgrade these into linear actuator connectors.

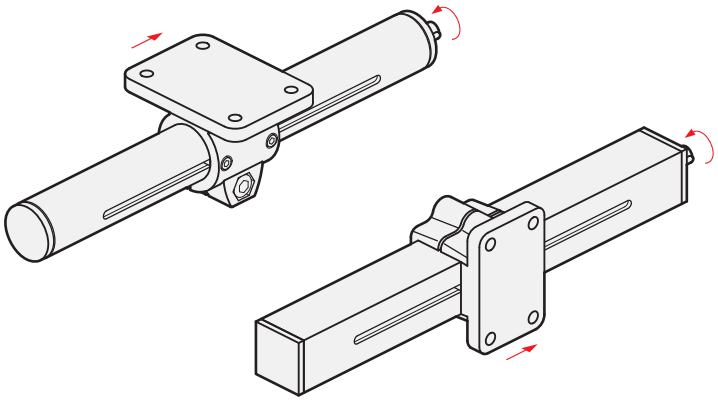
Also, digital position indicators (DD52, see page 721 / DD51, see page 718 / DD52R-E, see page 726 / DD51-E, see page 724) may be attached to measure the displacement or the positioning.

In applications where high torsion forces Mx occur, linear actuators with square tubing or double tube linear actuators should be given preference.

A wide variety of different components from the tube clamp connector program is also available for the square tubings. The linear actuator connectors are composed of two-part elements, with the effect that the precision of the square tubes involves no special requirements.

Linear actuators

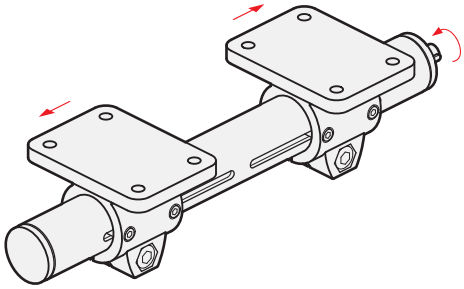
Types



DESCRIPTION

Linear actuator **GN 291** (see page 1912) with right **or** left hand thread, with shaft journal at either one or both ends, with a linear actuator connector **GN 146.1** (see page 1923).

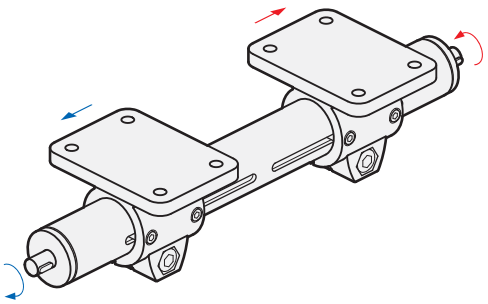
Square linear actuator GN 291.1 (see page 1930) with right **or** left hand thread, shaft journal at either one or both ends, with a linear actuator connector **GN 147.1** (see page 1933).



DESCRIPTION

Linear actuator **GN 292** (see page 1914) with left **and** right hand thread, shaft journal at either one or both ends, with two linear actuator connectors **GN 146.1** (see page 1923), the two connectors move symmetrically.

Square linear actuators **GN 292.1** on request.



DESCRIPTION

Linear actuator **GN 293** (see page 1915) with two separate threaded spindles, each with right **or** left hand thread with two linear actuator connectors **GN 146.1** (see page 1923), the two connectors move independently of one another.

Square linear actuators **GN 293.1** on request.

Linear actuators

Steel / Stainless Steel, with right or left hand thread

SPECIFICATION

Types

- Type **R1**: Right hand thread, shaft journal at one end
- Type **R2***: Right hand thread, shaft journal at both ends
- Type **L1**: Left hand thread, shaft journal at one end
- Type **L2***: Left hand thread, shaft journal at both ends

* usually not available from stock

Guide tube

Version in Steel
Tube DIN 2391
Steel, chrome-plated **SCR**

Version in Stainless Steel*
Tube DIN 2462
Stainless Steel AISI 304 **NI**

* usually not available from stock

Spindle with trapezoidal thread

- Steel respectively, Stainless Steel AISI 303
- ball bearing

Lead nut
Gunmetal

End cap
Plastic

INFORMATION

In addition to the standard stroke lengths specified in the above table for linear actuators GN 291 any stroke inside the maximum stroke length is available.
Besides the extensive range of tube clamp connectors there are a number of different components for fixing the linear actuators and to build linear actuator connectors.
In order to measure the displacement and positioning of the linear actuator connectors, digital as well as analogue position indicators can be installed and furthermore the guide tube can be provided with a longitudinal scale.

ACCESSORY

- Linear actuator connectors, tube clamp connectors have to be ordered seperately.

ON REQUEST

- Tube DIN 2462 in Stainless Steel **NI**

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)
- Stainless Steel characteristics (see page A26)
- Technical description of Linear actuators (see page 1910)

Tube DIN 2391
Steel, chrome-plated **SCR**

Version in Stainless Steel*
Tube DIN 2462
Stainless Steel AISI 304 **NI**

* usually not available from stock

Spindle with trapezoidal thread

- Steel respectively
- Stainless Steel AISI 303

ball bearing

Lead nut
Gunmetal

End cap
Plastic

INFORMATION

In addition to the standard stroke lengths specified in the above table for linear actuators GN 293 any stroke inside the maximum stroke length is available. Besides the extensive range of tube clamp connectors there are a number of different components for fixing the linear actuators and to build linear actuator connectors.
In order to measure the displacement and positioning of the linear actuator connectors, digital as well as analogue position indicators can be installed and furthermore the guide tube can be provided with a longitudinal scale.

ACCESSORY

- Linear actuator connectors, tube clamp connectors and accessory have to be ordered seperately.

ON REQUEST

- Special lengths

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)
- Stainless Steel characteristics (see page A26)
- Technical description of Linear actuators (see page 1910)

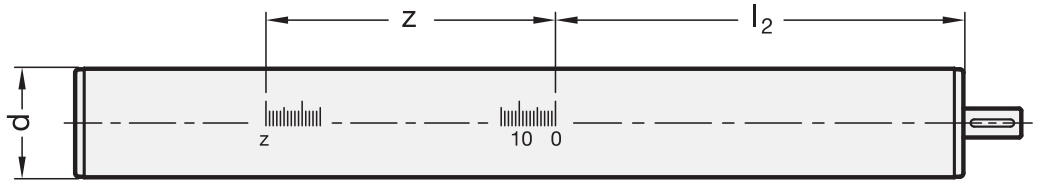
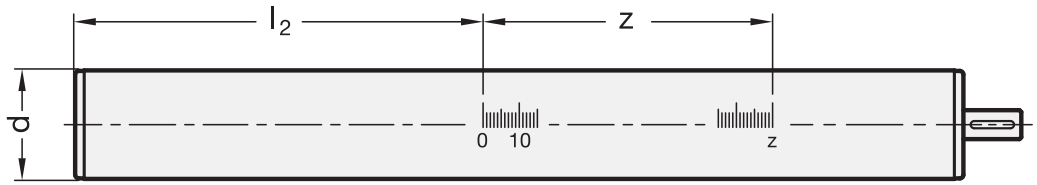
Longitudinal scales GN 299

for standard stroke lengths l1 of the linear actuators GN 291



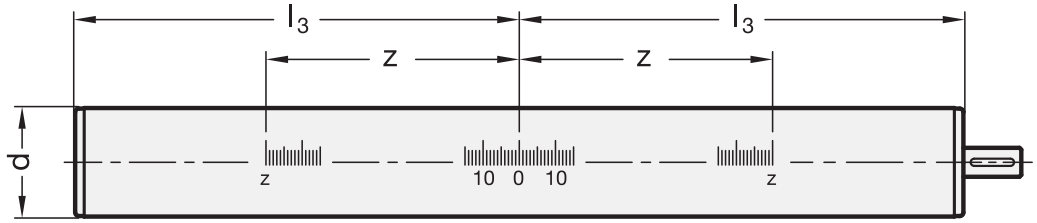
Type **A**

Scale values ascending to the left



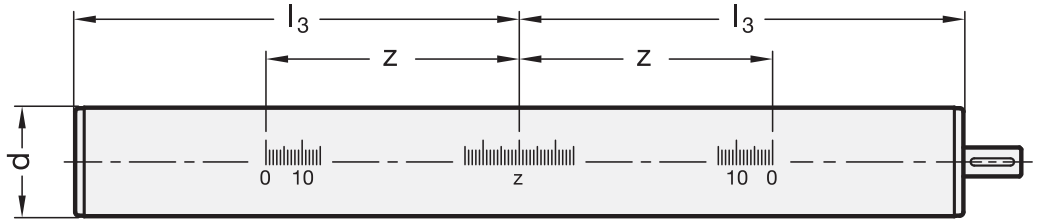
Type **B**

Scale values ascending to the right



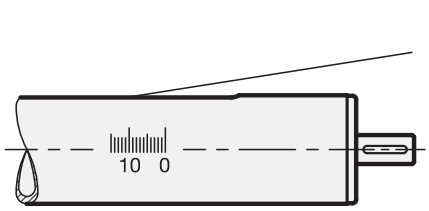
Type **C**

Scale values decreasing towards middle

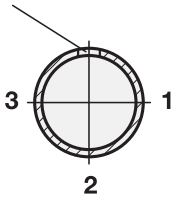


Type **D**

Scale values ascending towards middle



Guide slot for linear actuator connectors



The identification numbers 1, 2 or 3 determine the positioning of the scale relative to the guide slot.

Longitudinal scales GN 299

for standard stroke lengths l1 of the linear actuators GN 291

SPECIFICATION

Scale engraved
with laser precision

INFORMATION

The longitudinal scales GN 299 of type A and B are normally used in connection with the linear actuators GN 291 (see page 1912) and GN 291.1 (see page 1930). The scales of type C and D are normally used for the linear actuators GN 292 (see page 1914) and GN 293 (see page 1915).
Longitudinal scales can **only** be ordered together with linear actuators.

*Complete with Identifcation no. of the Longitudinal scales

Linear actuator connectors

for linear actuators Ø18, for single axis system

SPECIFICATION

Identification No.

No. **2**: with 2 Stainless Steel-Clamping screws DIN 912

Version in Aluminium
plastic coated
black, RAL 9005, textured finish **SW**

Version in Stainless Steel AISI CF-8 NI

- matt shot-blasted
- Bore only with slide bushing (G18)

Clamping bores mechanically machined

Slide bushing
Polyamide

Socket cap screw DIN 912
Stainless Steel AISI 304

Hexagon nuts DIN 985
Stainless Steel AISI 304

INFORMATION

GN 131.1 linear actuator connectors are normally supplied **mounted** only in connection with a linear actuator and for function control.
By means of the clamping screws on the guide bores d_1 / d_2 the movement can either be set or the linear actuator connector can be clamped (after setting of final adjustment).
The standard version of the clamping screws are socket cap screws with hexagonal socket DIN 912. They can be replaced by adjustable clamping levers GN 911 (see page 1874) (see table of dimensions).

ACCESSORY

- Clamping kits GN 911 (see page 1874) / GN 911.3 (see page 1875)

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

GN 146.1

Flanged linear actuator connectors

Aluminium, for linear actuators Ø30, Ø40, Ø50, Ø60

SPECIFICATION

Identification No.

No. **2**: with Stainless Steel-Clamping screw DIN 912

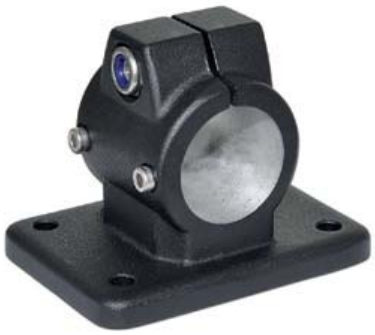
Aluminium
plastic coated
black, RAL 9005, textured finish **SW**

Guide bore mechanically machined

Slide bushing
Polyamide

Socket cap screws DIN 912
Stainless Steel AISI 304

Hexagon nuts DIN 985
Stainless Steel AISI 304



INFORMATION

GN 146.1 linear actuator connectors are normally supplied **mounted** only in connection with a linear actuator and for function control.
By means of the clamping screw on the guide bore d_1 the movement can either be set or the linear actuator connector can be clamped (after setting of final adjustment).
The standard version of the clamping screw is a socket cap screw with hexagonal socket DIN 912. It can be replaced by a clamping kit GN 911 (see page 1874) (article code see table of dimensions).

ACCESSORY

- Clamping kits GN 911 (see page 1874)

Square linear actuators

with right or left hand thread

SPECIFICATION

Types

- Type **R1**: Right hand thread, shaft journal at one end
- Type **R2***: Right hand thread, shaft journal at both ends
- Type **L1**: Left hand thread, shaft journal at one end
- Type **L2***: Left hand thread, shaft journal at both ends

* usually not available from stock

Square tube
Steel, chrome-plated **SCR**

Spindle with trapezoidal thread

- Steel
- ball bearing

Lead nut
Gunmetal

End cap
Plastic

INFORMATION

GN 291.1 Square linear actuators are used if the linear actuator connectors are exposed to high torsion forces.
In addition to the standard stroke lengths specified in the above table for linear actuators any stroke inside the maximum stroke length is available. Besides the extensive range of two-part tube clamp connectors there are a number of different components for fixing the linear actuators and to build linear actuator connectors.
In order to measure the displacement and positioning of the linear actuator connectors, the square tube can be provided with a longitudinal scale.

ACCESSORY

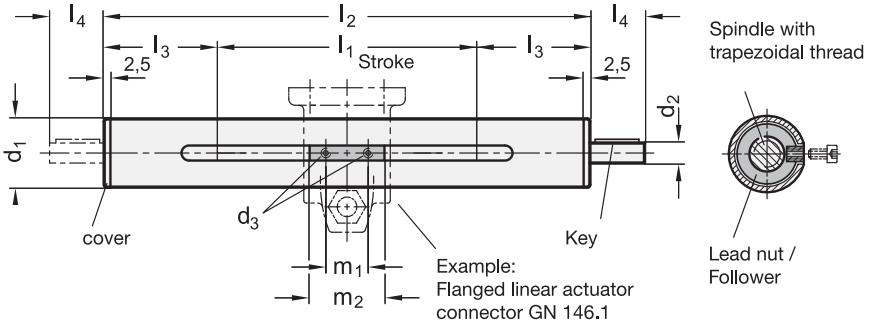
- Linear actuator connectors, tube clamp connectors and accessory have to be ordered separately.

ON REQUEST

- Square linear actuators GN 291.1 made of Stainless Steel.

TECHNICAL INFORMATION

- ISO-Fundamental tolerances (see page A21)



*Complete with Type of the Square linear actuators

Linear actuator connectors

Aluminium, same bore dimensions d_1 / s_1 and d_2 / s_2

SPECIFICATION

Identification No.

No. **2**: with 4 Stainless Steel-Clamping screws DIN 912

Aluminium
plastic coated
black, RAL 9005, textured finish **SW**

Clamping bores not machined

Fastening elements / Transfer elements

- Socket cap screws DIN 912
- Hexagon nuts DIN 985
- Centering bushings, follower

Stainless Steel AISI 304

INFORMATION

GN 134.1 linear actuator connectors are normally supplied **mounted** only in connection with a square linear actuator and for function control.
The fixing bores for the follower are always located in the lid of the bore d_1 and/or the square s_1. Centering bushings in the through-hole eliminate the axial clearance. The width of the s_1 square is dimensionally aligned with the play of the square linear actuators.
The square s_2 of the linear actuator connector is supplied not machined in the standard design.
The standard version of the clamping screws are socket cap screws with hexagonal socket DIN 912. They can be replaced by clamping kits GN 911 (see page 1874) (article code see table of dimensions).

ACCESSORY

Clamping kits GN 911 (see page 1874)

ON REQUEST

- Linear actuator connectors with little play
- other bore and square combinations
- GN 134.2 linear actuator connectors for double systems

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

Linear actuator connectors

Aluminium / multi part assembly / unequal bore dimensions, d1 / s1 and d2 / s2

SPECIFICATION

Identification No.

No. **2**: with 4 Stainless Steel-Clamping screws DIN 912

Aluminium
plastic coated
black, RAL 9005, textured finish **SW**

Clamping bores not machined

Fastening elements / Transfer elements

- Socket cap screws DIN 912
- Hexagon nuts DIN 985
- Centering bushings, follower

Stainless Steel AISI 304

INFORMATION

GN 135.1 Linear actuator connectors are normally supplied **mounted** only in connection with a square linear actuator and for function control.
The fixing bores for the follower are always located in the lid of the d1 bore and/or the s1 square. Centering bushings in the through-hole eliminate the axial clearance. The width of the s1 square is dimensionally aligned with the play of the square linear actuators.
The square s2 of the linear actuator connector is supplied not machined in the standard design.
The standard version of the clamping screws are socket cap screws with hexagonal socket DIN 912. They can be replaced by clamping kits GN 911 (see page 1874) (article code see table of dimensions).

ACCESSORY

- Clamping kits GN 911 (see page 1874)

ON REQUEST

- Linear actuator connectors with little play
- other bore and square combinations

TECHNICAL INFORMATION

- Stainless Steel characteristics (see page A26)

Aluminium
plastic coated
black, RAL 9005, textured finish **SW**

Clamping square not machined

Socket cap screws DIN 912
Stainless Steel AISI 304

Hexagon nuts DIN 985
Stainless Steel AISI 304

INFORMATION

GN 147.1 linear actuator connectors are normally supplied **mounted** only in connection with a square linear actuator and for function control.
The square of the linear actuator connector is supplied not machined in the standard design. Together with the tolerance of the tube, this may result in a relatively large play.
This can be adjusted in one direction using the clamping screws. In the other direction (90° to it), a defined minimum play can be achieved only by appropriate machining (special design) of the square linear actuator connector.
The standard version of the clamping screw is a socket cap screw with hexagonal socket DIN 912. It can be replaced by a clamping kit GN 911 (see page 1874) (article code see table of dimensions).

ACCESSORY

- Clamping kits GN 911 (see page 1874)

ON REQUEST

- Linear actuator connectors with little play

Installation kits

for position indicators used on linear actuators GN 291, GN 292, GN 293, GN 391

SPECIFICATION

Identification no.

No. **1**: for mechanical position indicators DD52R (see page 721) / DD51 (see page 718)
No. **2**: for electronic position indicators DD52R-E (see page 726) / DD51-E (see page 724)

Adaptor shaft
Steel
blackened

Torque support
Aluminium
black anodized

INFORMATION

The GN 295 installation kits are needed for mounting a position indicator on linear units. The installation kits comprise an adapter shaft and a torque support including attachment screws.
Order mechanical position indicators DD52R (see page 721) / DD51 (see page 718) / DD50 (see page 716) with a counter pitch that corresponds to that of the trapezoidal threaded spindle.
For position indicators DD52R-E (see page 726) / DD51-E (see page 724), the position indicator pitch is programmed.

ACCESSORY

Position indicators and handwheels have to be ordered separately.

ON REQUEST

- Linear actuators with analogue position indicator GA11 / GA12 (see page 695)

TECHNICAL INFORMATION

- ISO-Fundamental tolerances (see page A21)

Version in Stainless Steel NI
Tube DIN 2462
Stainless Steel AISI 304

Shaft

- Steel respectively Stainless Steel
- ball bearing

End cap
Plastic

INFORMATION

Transfer units GN 391 are normally used in connection with linear actuators (GN 291 see page 1912, GN 292 see page 1914, GN 293 see page 1915). They are designed to transfer the rotary movement for operating the linear actuators to another or a further position.
The transfer unit in the standard length l1 is a special design: It is designed to turn the operating axis for the linear actuators (handwheel) by 90° together with an angular gear.
As in linear actuators, digital position indicators can be fitted.

ACCESSORY

- Bevel gear wheels, handwheels, tube clamp connectors and accessory have to be ordered seperately.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)
- Stainless Steel characteristics (see page A26)
- Assembly and application examples of Transfer units (see page 1944)

Bevel gear wheels

with spiral bevel for linear actuators / transfer units with angular gear

SPECIFICATION

Types

- Type **R**: Bevel gear wheel, right-hand pitch
- Type **L**: Bevel gear wheel, left-hand pitch
- Type **W**: Set of bevel gears, 2 bevel gears, 1 x right-hand, 1 x left-hand pitch
- Type **T**: Set of bevel gears, 3 bevel gears, 1 x right-hand, 2 x left-hand pitch

Steel
hardened

Teeth milled

INFORMATION

Bevel gear wheels GN 297 are used for angular / T-gears in connection with linear actuators / transfer units and housings GN 298 (see page 1942).
The spiral bevel facilitates both setting the desired clearance and locating the correct position of the bevel gears. Also, gears set up this way run with extremely low noise levels.
Two bevel gears are needed for an angular gear, three bevel gears are needed for a T-gear. These are available as set in Type W and Type T resp.
Please note that only bevel gears with different pitches can be paired. The transmission ratio is always 1:1, because the bevel gears always have the same number of teeth.

TECHNICAL INFORMATION

- ISO-Fundamental Tolerances (see page A21)
- Assembly and application examples of Transfer units (see page 1944)

Housings

for angular gears / T-gears

SPECIFICATION

Types

- Type **W**: Housing for angular gears
- Type **T**: Housing for T-gears

Aluminium gravity die casting

plastic coated
black, RAL 9005, textured finish **SW**

Thrust screws
Stainless Steel

INFORMATION

Housings GN 298 for angular / T-gears are used in connection with bevel gear wheels GN 297 (see page 1942) and linear actuators / transfer units. The angular / T-gears are designed to deflect the rotary movement of a linear actuator / transfer unit by 90°.
An operating instruction with more details and specifications is included with every delivery.

TECHNICAL INFORMATION

- Assembly and application examples of Transfer units (see page 1944)

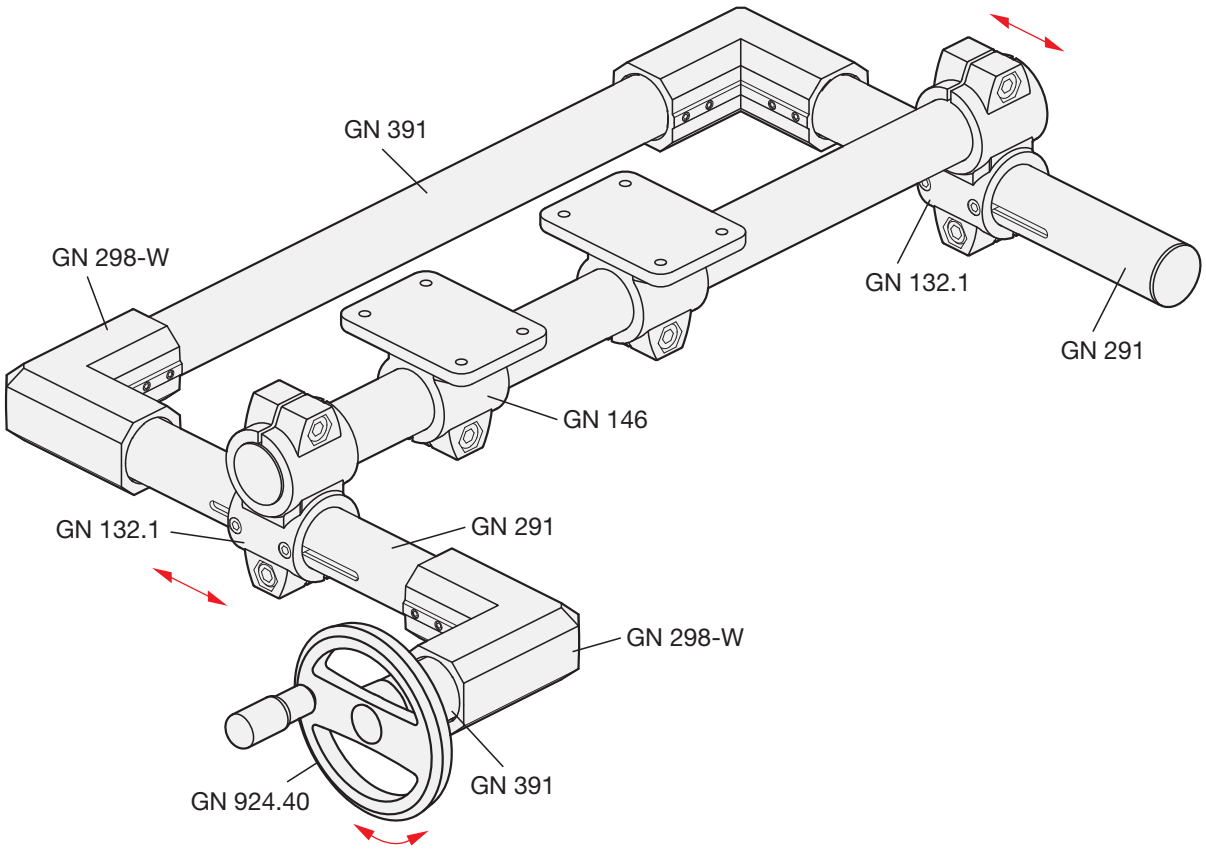
Transfer unit and angular gears

Application example

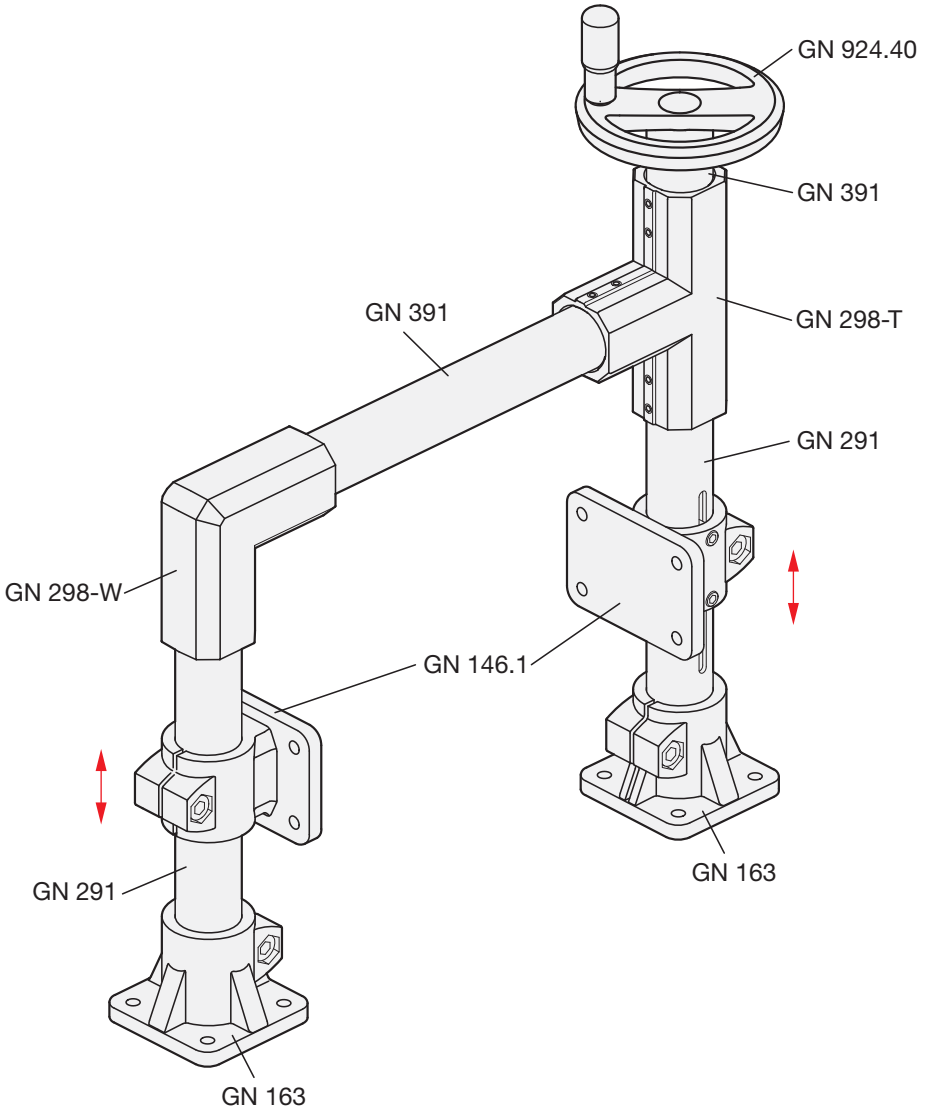


Two parallel sliding linear actuators GN 291 (see page 1912) are connected with a transfer unit GN 391 (see page 1940).

The angular housings GN 298-W (see page 1942) including the bevel gear wheels GN 297 (see page 1941) and another transfer unit GN 391 connect the handwheel with the system. The handwheel is placed in a rectangular position to the moving axes.

Transfer unit and angular gears

Application example



Two flanged linear actuator connectors GN 146.1 (see page 1923) are moved parallel. For this two linear actuators GN 291 (see page 1912) are connected with a transfer unit GN 391 (see page 1940).

The T- and angular gear GN 298-T/-W (see page 1942) including the bevel gear wheels GN 297 (see page 1941) and another transfer unit GN 391 (see page 1940) connect the handwheel with the system. The handwheel is placed in a parallel position to the moving axes.

The specified forces Fy and Fz cause a flexure of the guide tube of approx. 0.5 mm.

DESCRIPTION

The slider is moved via a bearing-type trapezoidal thread spindle and a guide nut. The slider is guided through two parallel chrome-plated tubes, resulting in a high load capacity and allowing high bending moments to be compensated by the linear actuator.

For type GN 492 (see page 1952), a second slider and an adapter plate extend the options for applications.

These double tube linear actuators have been designed for manual operation (handwheel). With the appropriate lubrication, they can also absorb rotary spindle speeds of as much as 250 rpm.

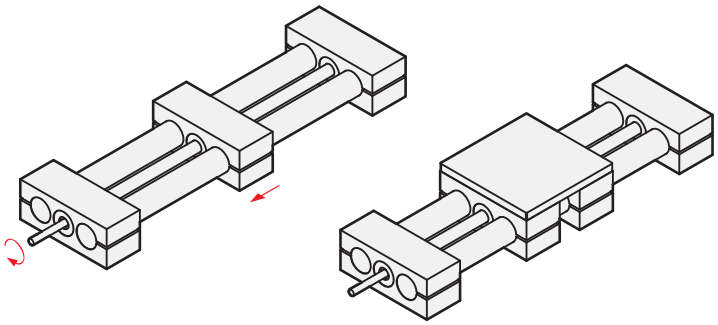
The positioning accuracy is 0.2 mm / 300 mm travel, the maximum reverse play is 0.1 mm.

To measure the adjustment or the positioning, digital position indicators DD52R (see page 721) / DD51 (see page 718) / DD52R-E (see page 726) / DD51-E (see page 722) may be attached. The required extension of the shaft journal is enabled by installation kits GN 491.1 (see page 1955).

Further information see on the standard pages of GN 491 (see page 1948) / GN 492 (see page 1952).

Double tube linear actuators

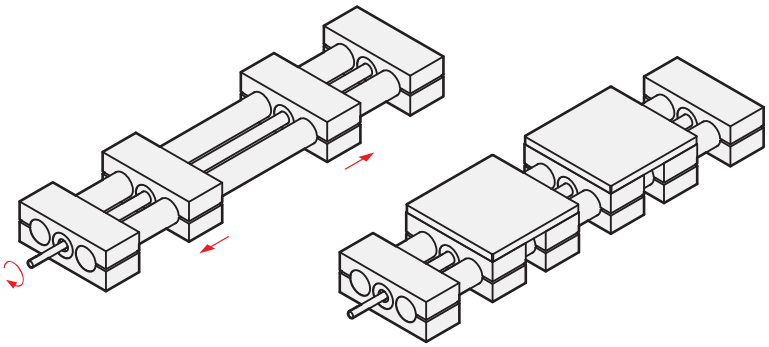
Technical description



GN 491 **GN 492**

DESCRIPTION

Double tube linear actuators
GN 491 / GN 492
(see page 1948 / see page 1952)
with right or left hand thread,
single shaft end or two shaft ends.

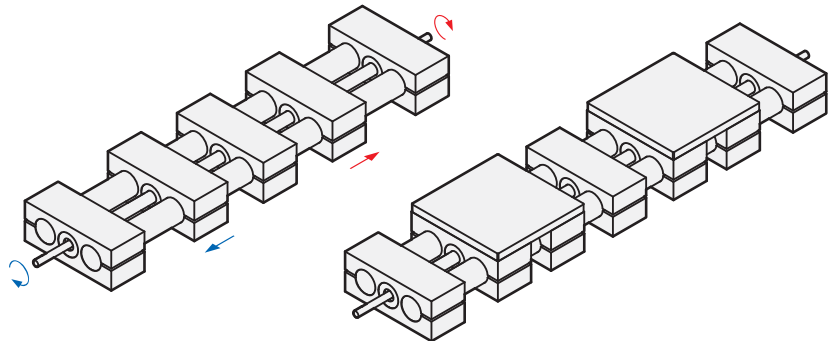


GN 493 **GN 494**

DESCRIPTION

Double tube linear actuators
GN 493 / GN 494
with right and left hand thread,
single shaft end or two shaft ends,
both sliders move symmetrically.

On request:
Double tube linear actuators
GN 493 / GN 494



GN 495 **GN 496**

DESCRIPTION

Double tube linear actuators
GN 495 / GN 496
with two separate spindles,
each with right or left hand thread, both
sliders move independently of each
other.

On request:
Double tube linear actuators
GN 495 / GN 496.

Double tube linear actuators

with right or left hand thread, single slider

SPECIFICATION

Types

- Type **R1**: Right hand thread, shaft journal at one end

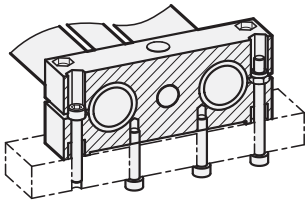
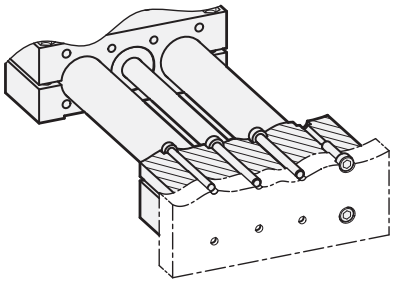
** useable depth of thread from both sides min. 2 x d_3 | *** useable depth of thread min. 1.5 x d_4

Mounting facilities of the end pieces

Horizontal
with screws for thread d4 or bore d5



Vertical
From outside, with screws for thread d3
From inside, with screws for bore d6
From inside, with screws for bore d5 / d7



Mounting facilities at the slider

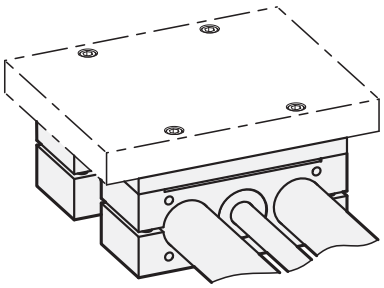
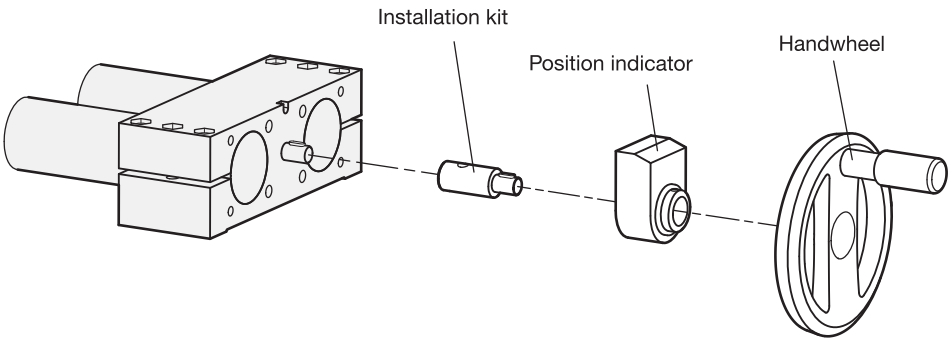
Mounting with screws for thread d8



Assembly of position indicator and handwheel

Useage of installation kit, position indicator and handwheel, see table.



GN 491.1

Installation kits

for position indicators used on linear actuators
GN 491 / GN 492

SPECIFICATION

Identification no.

- No. **1**: for mechanical position indicators DD52R / DD51 / DD50
- No. **2**: for electrical position indicators DD52R-E / DD51-E

Adaptor shaft
Steel
blackened

Torque support
Aluminium
black anodized

INFORMATION

The installation kits GN 491.1 are required for the attachment of a position indicator to double tube linear actuators. They consist of an adapter shaft and, depending on the position indicator, a torque support including fixing screws.
Mechanical position indicators DD52R (see page 726)/ DD51 (see page 718) / DD50 (see page 716) must be ordered so that the counter is aligned with the rising of the trapezoidal thread spindle.
For the position indicators DD52R-E (see page 726) / DD51-E (see page 722) the respective rising is set at the position indicator for every programming.

ACCESSORY

Position indicators and handwheels have to be ordered separately.

TECHNICAL INFORMATION

- ISO-Fundamental tolerances (see page A21)

made in
Italy

made in
Italy

DESIGNED
FOR ENGINEERING

17 Castors and wheels

Injected polyurethane wheels

Technopolymer wheels

Rubber wheels

Duroplast wheels

Mould-on polyurethane wheels

Aluminium centre body

COVERING
Mould-on polyurethane, hardness 95 Shore A.

WHEEL CENTRE BODY
Pressure die-cast aluminium.

ROLLING ACTION
Hub with ball bearings. Ideal solution for heavy loads and continuous moving.

APPLICATIONS
Excellent smoothness and elasticity features, high wear and tearing resistance.
For selection parameters see Technical data on page 2013.
RE.F5 wheels are supplied also with bracket:
- RE.F5-N (see page 1959): wheels with steel sheet bracket to be used for light loads.
- RE.F5-H (see page 1961): wheels with steel sheet bracket to be used for medium-heavy loads.

ENVIRONMENTAL CONDITIONS
Suitable for use in environments with the presence of atmospheric agents, alcohols and glycols; use in environments with the presence of organic and mineral acids, basic solutions and saturated vapour is not recommended.

ROLLING RESISTANCE - FORCE / LOAD APPLIED
The diagram shows the force to be applied to a wheel to keep it moving at the constant speed of 4 km/h, according to the applied load.
The intersection point with a 50N value is the maximum transportable load with a manually actuated 4-wheel trolley; in fact, 200N = 50N x 4 wheels is the maximum force that may be supported by the operator according to the regulations in force regarding work safety.

MECHANICAL MOVING WITH TOWING DEVICES
For mechanical towing, please see the technical specifications to determine the capacity variation.

TEMPERATURE
If operating temperatures in an application differ from the standard range of values, please see the technical specifications to determine the capacity variation.

For static load, rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

RE.F5-N

RoHS 2000 - 3000 N

Mould-on polyurethane wheels

Steel sheet bracket

COVERING
Mould-on polyurethane, hardness 95 Shore A.

WHEEL CENTRE BODY
Pressure die-cast aluminium.

ROLLING ACTION
Hub with ball bearings. Ideal solution for heavy loads and continuous moving.

FIXED PLATE BRACKET
Zinc-plated steel sheet, the bracket is designed to withstand loads up to 3000N.

TURNING PLATE BRACKET
Zinc-plated steel sheet, the bracket is designed to withstand loads up to 3000N.
The presence of a double ball race turns and the direct contact between the plate and the ball race ring with built-in pin ensure excellent manoeuvrability.
Does not require maintenance.
It consists of (see Fig.1):
1. fitting plate: electrolytically zinc-plated steel plate;
2. fork: electrolytically zinc-plated steel plate;
3. ball race ring: electrolytically zinc-plated steel plate;
4. central pin: incorporated in the plate, cold reflanged;
5. rotation system: dual grease-lubricated ball race;
6. dust seal: RAL 7015 dark grey technopolymer.

BRAKE
Total brake that locks the wheel and bracket rotation.
The optimised dimensions and the retractable pedal ensure minimal space occupied and maximum actuation ease.
Hardened carbon steel spring.
The trolley must be turned to use the device.
The brake is simple and effective to use: it is actuated and released by a simple action from the top downward at the tip of two separate pedals, thus ensuring the utmost manoeuvring comfort.
The braking efficacy may be adjusted with a socket head screw M8.

STANDARD EXECUTIONS
- **PSL-N**: fixed plate bracket, without brake.
- **SSL-N**: turning plate bracket, without brake.
- **SSF-N**: turning plate bracket, with brake.
- **FSL-N**: turning plate bracket and centre pass-through hole, without brake.
- **FSF-N**: turning plate bracket and centre pass-through hole, with brake.

APPLICATIONS
Excellent smoothness and elasticity features, high wear and tearing resistance.
For further information see RE.F5 (on page 1958).

RE.F5-H

RoHS 3500 - 7500 N

Mould-on polyurethane wheels

Steel sheet bracket for medium-heavy loads

COVERING
Mould-on polyurethane, hardness 95 Shore A.

WHEEL CENTRE BODY
Pressure die-cast aluminium.

ROLLING ACTION
Hub with ball bearings. Ideal solution for heavy loads and continuous moving.

FIXED PLATE BRACKET
Yellow zinc-plated steel sheet (test in saline fog chamber above 72h). The bracket is designed to withstand loads up to 7500N. It ensures capacities that make it suitable for heavy industrial applications.

TURNING PLATE BRACKET
Yellow zinc-plated steel sheet (test in saline fog chamber above 72h). The bracket is designed to withstand loads up to 7500N. It ensures capacities that make it suitable for heavy industrial applications.
It consists of (see Fig.1):
1. fitting plate: yellow zinc-plated steel sheet;
2. fork: yellow zinc-plated steel sheet;
3. ball race ring: yellow zinc-plated steel sheet;
4. central pin: class 8.8 steel screw and steel nut;
5. rotation system: dual grease-lubricated ball race;
6. dust seal: RAL 7015 dark grey technopolymer.

BRAKE
Front brake (RE.F5-125) or rear brake (RE.F5-150-200) dual-effect with simultaneous locking of wheel and bracket.
The brake is simple and effective to use: it is actuated and released by a simple action from the top downward at the tip of two separate pedals, thus ensuring the utmost manoeuvring comfort.
The braking efficacy may be adjusted with a socket head screw M8.

STANDARD EXECUTIONS
- **PSL-H**: fixed bracket, without brake.
- **SSL-H**: turning plate bracket, without brake.
- **SSF-H**: turning plate bracket, with brake.

APPLICATIONS
Excellent smoothness and elasticity features, high wear and tearing resistance.
For further information see RE.F5 on page 1958.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

Soft polyurethane wheels

Aluminium centre body

COVERING
Soft mould-on polyurethane, hardness 75 Shore A.

WHEEL CENTRE BODY
Pressure die-cast aluminium.

ROLLING ACTION
Hub with ball bearings. Ideal solution for heavy loads and continuous moving.

APPLICATIONS
Excellent smoothness and elasticity features, high wear and tearing resistance.
For selection parameters see Technical data on page 2013.
RE.F2 wheels are supplied also with bracket:
- RE.F2-N (see page 1964): wheels with steel sheet bracket to be used for light loads.
- RE.F2-H (see page 1966): wheels with steel sheet bracket to be used for medium-heavy loads.
- RE.F2-WH (see page 1968): wheels with electro-welded steel bracket to be used for heavy loads.

ENVIRONMENTAL CONDITIONS
Suitable for use in environments with the presence of atmospheric agents, alcohols and glycols; use in environments with the presence of organic and mineral acids, basic solutions and saturated vapour is not recommended.

ROLLING RESISTANCE - FORCE / LOAD APPLIED
The diagram shows the force to be applied to a wheel to keep it moving at the constant speed of 4 km/h, according to the applied load.
The intersection point with a 50N value is the maximum transportable load with a manually actuated 4-wheel trolley; in fact, 200N = 50N x 4 wheels is the maximum force that may be supported by the operator according to the regulations in force regarding work safety.

MECHANICAL MOVING WITH TOWING DEVICES
For mechanical towing, please see the technical specifications to determine the capacity variation.

TEMPERATURE
If operating temperatures in an application differ from the standard range of values, please see the technical specifications to determine the capacity variation.

RoHS 2000 N

Soft polyurethane wheels

Steel sheet bracket

COVERING
Soft mould-on polyurethane, hardness 75 Shore A.

WHEEL CENTRE BODY
Pressure die-cast aluminium.

ROLLING ACTION
Hub with ball bearings. Ideal solution for heavy loads and continuous moving.

FIXED PLATE BRACKET
Zinc-plated steel sheet, the bracket is designed to withstand loads up to 2000N.

TURNING PLATE BRACKET
Zinc-plated steel sheet, the bracket is designed to withstand loads up to 2000N.
The presence of a double ball race turns and the direct contact between the plate and the ball race ring with built-in pin ensure excellent manoeuvrability.
Does not require maintenance.
It consists of (see Fig.1):
1. fitting plate: electrolytically zinc-plated steel plate;
2. fork: electrolytically zinc-plated steel plate;
3. ball race ring: electrolytically zinc-plated steel plate;
4. central pin: incorporated in the plate, cold reflanged;
5. rotation system: dual grease-lubricated ball race;
6. dust seal: RAL 7015 dark grey technopolymer.

BRAKE
Total brake that locks the wheel and bracket rotation.
The optimised dimensions and the retractable pedal ensure minimal space occupied and maximum actuation ease.
Hardened carbon steel spring.
The trolley must be turned to use the device.
The brake is simple and effective to use: it is actuated and released by a simple action from the top downward at the tip of two separate pedals, thus ensuring the utmost manoeuvring comfort.
The braking efficacy may be adjusted with a socket head screw M8.

STANDARD EXECUTIONS
- **PSL-N**: fixed plate bracket, without brake.
- **SSL-N**: turning plate bracket, without brake.
- **SSF-N**: turning plate bracket, with brake.

APPLICATIONS
Excellent smoothness and elasticity features, high wear and tearing resistance.
For further information see RE.F2 on page 1963.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

RoHS 5500 - 7000 N

Soft polyurethane wheels

Electro-welded steel bracket for heavy loads

COVERING
Soft mould-on polyurethane, hardness 75 Shore A.

WHEEL CENTRE BODY
Pressure die-cast aluminium.

ROLLING ACTION
Hub with ball bearings. Ideal solution for heavy loads and continuous moving.

FIXED PLATE BRACKET
Electrolytically zinc-plated electro-welded steel. The bracket is designed to withstand loads up to 7000N. Suitable for heavy industrial applications and for severe conditions of use, such as impact and high speeds.

TURNING PLATE BRACKET
Electrolytically zinc-plated electro-welded steel. The presence of an axial bearing and a conical bearing ensures excellent manoeuvrability also at full load and increases the resistance of the bracket against side impact. It is equipped with lubricator and anti-loosening system of the locking nut.The bracket is designed to withstand loads up to 7000N. Suitable for heavy industrial applications and for severe conditions of use, such as impact and high speeds.
It consists of (see fig.1):
1. fitting plate: forged steel with built-in pin, electrolytically zinc-plated;
2. fork: drawn sides electro-welded to the flange, electrolytically zinc-plated;
3. rotation system: axial ball bearing and conical roller bearing;
4. lubricator;
5. anti-loosening system of the locking nut.

BRAKE
Dual-effect rear brake with simultaneous locking of wheel and bracket. The brake is simple and effective to use: it is actuated and released by a simple action from the top downward at the tip of two separate pedals, thus ensuring the utmost manoeuvring comfort. The braking efficacy may be adjusted with a socket head screw M8.

STANDARD EXECUTIONS
- **PSL-WH**: fixed plate bracket, without brake.
- **SSL-WH**: turning plate bracket, without brake.
- **SSF-WH**: turning plate bracket, with brake.

APPLICATIONS
Suitable for heavy industrial applications and severe conditions of use, such as impact and high speeds. The mould-on polyurethane wheel ensures excellent rolling resistance and elasticity, high wear and tearing resistance. For further information see RE.F2 on page 1963.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

Mould-on polyurethane wheels

Cast iron centre body

COVERING
Mould-on polyurethane, hardness 95 Shore A.

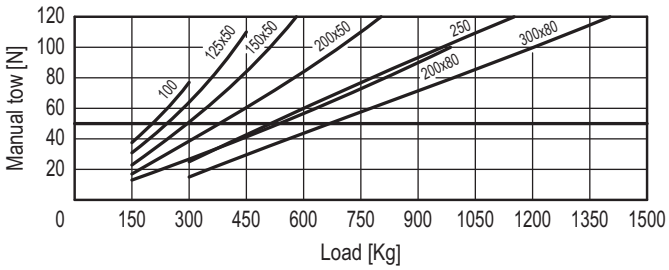
WHEEL CENTRE BODY
Cast iron.

STANDARD EXECUTIONS
- **RBL**: hub directly made into the centre. The wheel hub is designed to be easily reprocessed to obtain a keyway or housing for clamping. Any further reprocesses on the wheel must be carried out with maximum working temperature up to 80°C, (recommended max limit temperature during normal use of the product) to prevent degradation of the polyurethane coating.Ideal solution for equipment with drive wheels.
- **RSL**: hub with ball bearings. Ideal solution for heavy loads and continuous moving.

APPLICATIONS
Excellent smoothness and elasticity features, high wear and tearing resistance.
For selection parameters see Technical Data on page 2013.
RE.F4 wheels are supplied also with bracket:
- RE.F4-H (see page 1972): wheels with steel sheet bracket to be used for medium-heavy loads.
- RE.F4-WH (see page 1974): wheels with electro-welded steel bracket to be used for heavy loads
- RE.F4-WEH (see page 1976): wheels with electro-welded steel bracket to be used for extra-heavy loads.

ENVIRONMENTAL CONDITIONS
Suitable for use in environments with the presence of atmospheric agents, alcohols and glycols; use in environments with the presence of organic and mineral acids, basic solutions and saturated vapour is not recommended.

ROLLING RESISTANCE - FORCE / LOAD APPLIED
The diagram shows the force to be applied to a wheel to keep it moving at the constant speed of 4 km/h, according to the applied load.
The intersection point with a 50N value is the maximum transportable load with a manually actuated 4-wheel trolley; in fact, 200N = 50N x 4 wheels is the maximum force that may be supported by the operator according to the regulations in force regarding work safety.



MECHANICAL MOVING WITH TOWING DEVICES
For mechanical towing, please see the technical specifications to determine the capacity variation.

TEMPERATURE
If operating temperatures in an application differ from the standard range of values, please see the technical specifications to determine the capacity variation.
Hole with keyway in compliance with UNI 6604, UNI 6607 e ISO 2941 (RBL version).

***** Max diameter permissible for hole to ensure the static load values reported.

For static load, rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

Mould-on polyurethane wheels

Steel sheet bracket for medium-heavy loads

COVERING
Mould-on polyurethane, hardness 95 Shore A.

WHEEL CENTRE BODY
Cast iron.

ROLLING ACTION
Hub with ball bearings. Ideal solution for heavy loads and continuous moving.

FIXED PLATE BRACKET
Yellow zinc-plated steel sheet (test in saline fog chamber above 72h). The bracket is designed to withstand loads up to 7500N. It ensures capacities that make it suitable for heavy industrial applications.

TURNING PLATE BRACKET
Yellow zinc-plated steel sheet (test in saline fog chamber above 72h). The presence of a double ball race turns and the direct contact between the plate and the ball race ring with built-in pin ensure excellent manoeuvrability. Does not require maintenance. The bracket is designed to withstand loads up to 7500N. It ensures capacities that make it suitable for heavy industrial applications.
It consists of (see Fig.1):
1. fitting plate: yellow zinc-plated steel sheet;
2. fork: yellow zinc-plated steel sheet;
3. ball race ring: yellow zinc-plated steel sheet;
4. central pin: class 8.8 steel screw and steel nut;
5. rotation system: dual grease-lubricated ball race;
6. dust seal: RAL 7015 dark grey technopolymer.

BRAKE
Front brake (RE.F4-100) or rear brake (RE.F4-125-150-200) dual-effect with simultaneous locking of wheel and bracket. The brake is simple and effective to use: it is actuated and released by a simple action from the top downward at the tip of two separate pedals, thus ensuring the utmost manoeuvring comfort.The braking efficacy may be adjusted with a socket head screw M8.

STANDARD EXECUTIONS
- **PSL-H**: fixed bracket, without brake.
- **SSL-H**: turning plate bracket, without brake.
- **SSF-H**: turning plate bracket, with brake.

APPLICATIONS
Suitable for heavy industrial applications. The mould-on polyurethane wheel ensures excellent rolling resistance and elasticity, high wear and tearing resistance. For further information see RE.F4 on page 1970.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

Mould-on polyurethane wheels

Electro-welded steel bracket for heavy loads

COVERING
Mould-on polyurethane, hardness 95 Shore A.

WHEEL CENTRE BODY
Cast iron.

ROLLING ACTION
Hub with ball bearings. Ideal solution for heavy loads and continuous moving.

FIXED PLATE BRACKET
Electrolytically zinc-plated electro-welded steel. The bracket is designed to withstand loads up to 9000N. Suitable for heavy industrial applications and for severe conditions of use, such as impact and high speeds.

TURNING PLATE BRACKET
Electrolytically zinc-plated electro-welded steel. The presence of an axial bearing and a conical bearing ensures excellent manoeuvrability also at full load and increases the resistance of the bracket against side impact. It is equipped with lubricator and anti-loosening system of the locking nut.The bracket is designed to withstand loads up to 9000N. Suitable for heavy industrial applications and for severe conditions of use, such as impact and high speeds.
It consists of (see fig.1):
1. fitting plate: forged steel with built-in pin, electrolytically zinc-plated;
2. fork: drawn sides electro-welded to the flange, electrolytically zinc-plated;
3. rotation system: axial ball bearing and conical roller bearing;
4. lubricator;
5. anti-loosening system of the locking nut.

BRAKE
Dual-effect rear brake with simultaneous locking of wheel and bracket. The brake is simple and effective to use: it is actuated and released by a simple action from the top downward at the tip of two separate pedals, thus ensuring the utmost manoeuvring comfort. The braking efficacy may be adjusted with a socket head screw M8.

STANDARD EXECUTIONS
- **PSL-WH**: fixed plate bracket, without brake.
- **SSL-WH**: turning plate bracket, without brake.
- **SSF-WH**: turning plate bracket, with brake.

APPLICATIONS
Suitable for heavy industrial applications and severe conditions of use, such as impact and high speeds. The mould-on polyurethane wheel ensures excellent rolling resistance and elasticity, high wear and tearing resistance. For further information see RE.F4 on page 1970.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

RoHS | 10000 - 23000 N

Mould-on polyurethane wheels

Electro-welded steel bracket for extra-heavy loads

COVERING
Mould-on polyurethane, hardness 95 Shore A.

WHEEL CENTRE BODY
Cast iron.

ROLLING ACTION
Hub with ball bearings. Ideal solution for heavy loads and continuous moving.

FIXED PLATE BRACKET
Electro-welded steel with dark green powder coating. The bracket is designed to withstand loads up to 23000 N. Suitable for heavy industrial applications and for severe conditions of use, such as impact and high speeds.

TURNING PLATE BRACKET
Electro-welded steel with dark green powder coating.
The presence of an axial bearing and a conical bearing ensures excellent manoeuvrability also at full load and increases the resistance of the bracket against side impact. It is equipped with lubricator and anti-loosening system of the locking nut. The bracket is designed to withstand loads up to 23000 N. Suitable for heavy industrial applications and for severe conditions of use, such as impact and high speeds.
It consists of (see Fig.1):
1. fitting plate: forged steel with built-in pin, dark green powder coating;
2. fork: drawn sides electro-welded to the flange, dark green powder coating;
3. rotation system: axial ball bearing and conical roller bearing;
4. lubricator;
5. anti-loosening system of the locking nut.

BRAKE
Dual-effect rear brake with simultaneous locking of wheel and bracket. The brake is simple and effective to use: it is actuated and released by a simple action from the top downward at the tip of two separate pedals, thus ensuring the utmost manoeuvring comfort. The braking efficacy may be adjusted with a socket head screw M8.

STANDARD EXECUTIONS
- **PSL-WEH**: fixed plate bracket, without brake.
- **SSL-WEH**: turning plate bracket, without brake.
- **SSF-WEH**: turning plate bracket, with brake.

APPLICATIONS
Suitable for heavy industrial applications and severe conditions of use, such as impact and high speeds. The mould-on polyurethane wheel ensures excellent rolling resistance and elasticity, high wear and tearing resistance.For further information see RE.F4 on page 1970.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

Mould-on polyurethane rollers

Steel centre body

COVERING
Mould-on polyurethane, hardness 95 Shore A.

WHEEL CENTRE BODY
Steel.

ROLLING ACTION
Hub with ball bearings. Ideal solution for heavy loads and continuous moving.

APPLICATIONS
Excellent smoothness and elasticity features, high wear and tearing resistance. For selection parameters see Technical Data on page 2013.

ENVIRONMENTAL CONDITIONS
Suitable for use in environments with the presence of atmospheric agents, alcohols and glycols; use in environments with the presence of organic and mineral acids, basic solutions and saturated vapour is not recommended.

ROLLING RESISTANCE - FORCE / LOAD APPLIED
The diagram shows the force to be applied to a wheel to keep it moving at the constant speed of 4 km/h, according to the applied load. The intersection point with a 50N value is the maximum transportable load with a manually actuated 4-wheel trolley; in fact, 200N = 50N x 4 wheels is the maximum force that may be supported by the operator according to the regulations in force regarding work safety.

MECHANICAL MOVING WITH TOWING DEVICES
For mechanical towing, please see the technical specifications to determine the capacity variation.

TEMPERATURE
If operating temperatures in an application differ from the standard range of values, please see the technical specifications to determine the capacity variation.

For static load, rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

RoHS 1200 - 3500 N

Injected polyurethane wheels

Technopolymer centre body

COVERING
Injected polyurethane, hardness 55 Shore D.

WHEEL CENTRE BODY
Polyamide-based technopolymer (PA).

ROLLING ACTION
Hub with pass-through hole.

APPLICATIONS
Excellent smoothness and elasticity features, good wear and tearing resistance.
For selection parameters see Technical data on page 2013.
RE.FF wheels are also supplied with steel sheet brackets RE.FF-N (see page 1980).

ENVIRONMENTAL CONDITIONS
Suitable for use in environments with the presence of atmospheric agents, alcohols and glycols; weak organic and mineral acids, water and saturated vapour.

ROLLING RESISTANCE - FORCE / LOAD APPLIED
The diagram shows the force to be applied to a wheel to keep it moving at the constant speed of 4 km/h, according to the applied load.
The intersection point with a 50N value is the maximum transportable load with a manually actuated 4-wheel trolley; in fact, 200N = 50N x 4 wheels is the maximum force that may be supported by the operator according to the regulations in force regarding work safety.

INOX STAINLESS STEEL | RoHS | 1200 - 3000 N

Injected polyurethane wheels

Steel or stainless steel sheet bracket

COVERING
Injected polyurethane, hardness 55 Shore D.

WHEEL CENTRE BODY
Polyamide-based technopolymer (PA).

ROLLING ACTION
Hub with pass-through hole.

FIXED PLATE BRACKET
Zinc-plated steel or AISI 304 stainless steel (SST version) sheet, the bracket is designed to withstand loads up to 3000N.

TURNING PLATE BRACKET
Zinc-plated steel or AISI 304 stainless steel (SST version) sheet, the bracket is designed to withstand loads up to 3000N.
The presence of a double ball race and the direct contact between the plate and the ball race ring with built-in pin ensure excellent manoeuvrability.
Does not require maintenance.
It consists of (see Fig.1):
1. fitting plate: electrolytically zinc-plated steel or AISI 304 stainless steel sheet;
2. fork: electrolytically zinc-plated steel or AISI 304 stainless steel sheet;
3. ball race ring: electrolytically zinc-plated steel or AISI 304 stainless steel sheet;
4. central pin: incorporated in the plate, cold reflanged;
5. rotation system: dual grease-lubricated ball race;
6. dust seal: RAL 7015 dark grey technopolymer.

FRONT-ACTUATED BRAKE
Total brake that locks the wheel and bracket rotation.
The optimised dimensions and the retractable pedal ensure minimal space occupied and maximum actuation ease. Hardened carbon steel or stainless steel (SST version) spring.
The trolley must be turned to use the device. The brake is simple and effective to use: it is actuated and released by a simple action from the top downward at the tip of two separate pedals, thus ensuring the utmost manoeuvring comfort.
The braking efficacy may be adjusted with a socket head screw M8.

STANDARD EXECUTIONS
- **PBL**: fixed plate bracket, without brake.
- **SBL**: turning plate bracket, without brake.
- **SBF**: turning plate bracket, with brake.
- **FBL**: turning plate bracket and centre pass-through hole, without brake.
- **FBF**: turning plate bracket and centre pass-through hole, with brake.

Index for bracket material:
- **N**: zinc-plated steel plate bracket.
- **N-SST**: AISI 304 stainless steel bracket.

APPLICATIONS
Excellent smoothness and elasticity features, good wear and tearing resistance. For further information see wheel technical data sheet RE.FF on page 1979.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

Technopolymer wheels

Monolithic

WHEEL BODY
Polyamide-based technopolymer (PA).

STANDARD EXECUTIONS
- **RBL**: hub with pass-through hole.
- **RSL**: hub with ball bearings. Ideal solution for heavy loads and continuous moving.

APPLICATIONS
Excellent wear and tearing resistance. For selection parameters see Technical data on page 2013.
RE.F8 wheels are supplied also with bracket:
- RE.F8-N (see page 1984): wheels with steel sheet bracket.
- RE.F8-H (see page 1986): wheels with steel sheet bracket to be used for medium-heavy loads.
- RE.F8-WH (see page 1988): wheels with electro-welded steel bracket to be used for heavy loads.

ENVIRONMENTAL CONDITIONS
Suitable for use in humid environments, with the presence of highly aggressive chemicals. Use in environments with the presence of strong organic acids and concentrated minerals is not recommended.

ROLLING RESISTANCE - FORCE / LOAD APPLIED
The diagram shows the force to be applied to a wheel to keep it moving at the constant speed of 4 km/h, according to the applied load. The intersection point with a 50N value is the maximum transportable load with a manually actuated 4-wheel trolley; in fact, 200N = 50N x 4 wheels is the maximum force that may be supported by the operator according to the regulations in force regarding work safety.

MECHANICAL MOVING WITH TOWING DEVICES
For mechanical towing, please see the technical specifications to determine the capacity variation.

TEMPERATURE
If operating temperatures in an application differ from the standard range of values, please see the technical specifications to determine the capacity variation.

RE.F8-N

INOX STAINLESS STEEL | RoHS | 1200 - 3000 N

Technopolymer wheels

Steel or stainless steel sheet bracket

WHEEL CENTRE BODY
Polyamide-based technopolymer (PA).

ROLLING ACTION
Hub with pass-through hole.

FIXED PLATE BRACKET
Zinc-plated steel or AISI 304 stainless steel (SST version) sheet, the bracket is designed to withstand loads up to 3000N.

TURNING PLATE BRACKET
Zinc-plated steel or AISI 304 stainless steel (SST version) sheet, the bracket is designed to withstand loads up to 3000N. The presence of a double ball race turns and the direct contact between the plate and the ball race ring with built-in pin ensure excellent manoeuvrability. Does not require maintenance. It consists of (see Fig.1):

1. fitting plate: electrolytically zinc-plated steel or AISI 304 stainless steel sheet;
2. fork: electrolytically zinc-plated steel or AISI 304 stainless steel sheet;
3. ball race ring: electrolytically zinc-plated steel or AISI 304 stainless steel sheet;
4. central pin: incorporated in the plate, cold reflanged;
5. rotation system: dual grease-lubricated ball race;
6. dust seal: RAL 7015 dark grey technopolymer.

BRAKE
Total brake that locks the wheel and bracket rotation. The optimised dimensions and the retractable pedal ensure minimal space occupied and maximum actuation ease. Hardened carbon steel or stainless steel (SST version) spring.

STANDARD EXECUTIONS
- **PBL**: fixed plate bracket, without brake.
- **SBL**: turning plate bracket, without brake.
- **SBF**: turning plate bracket, with brake.
- **FBL**: turning plate bracket and centre pass-through hole, without brake.
- **FBF**: turning plate bracket and centre pass-through hole, with brake.

Index for bracket material:
- **N**: zinc-plated steel plate bracket.
- **N-SST**: AISI 304 stainless steel bracket.

APPLICATIONS
Excellent wear and tearing resistance. For further information see RE.F8 on page 1983.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

RoHS 3000 - 7300 N

Technopolymer wheels

Steel sheet bracket for medium-heavy loads

WHEEL CENTRE BODY
Polyamide-based (PA) technopolymer.

ROLLING ACTION
Hub with pass-through hole.

FIXED PLATE BRACKET
Yellow zinc-plated steel sheet (test in saline fog chamber above 72h). The bracket is designed to withstand loads up to 7500N. It ensures capacities that make it suitable for heavy industrial applications.

TURNING PLATE BRACKET
Yellow zinc-plated steel sheet (test in saline fog chamber above 72h).The presence of a double ball race turns and the direct contact between the plate and the ball race ring with built-in pin ensure excellent manoeuvrability. Does not require maintenance. The bracket is designed to withstand loads up to 7500N. It ensures capacities that make it suitable for heavy industrial applications.
It consists of (see fig.1):
1. fitting plate: yellow zinc-plated steel sheet;
2. fork: yellow zinc-plated steel sheet;
3. ball race ring: yellow zinc-plated steel sheet;
4. central pin: class 8.8 steel screw and steel nut;
5. rotation system: dual grease-lubricated ball race;
6. dust seal: RAL 7015 dark grey technopolymer.

BRAKE
Front brake (RE.F8-100-125) or rear brake (RE.F8-150-200) dual-effect with simultaneous locking of wheel and bracket. The brake is simple and effective to use: it is actuated and released by a simple action from the top downward at the tip of two separate pedals, thus ensuring the utmost manoeuvring comfort. The braking efficacy may be adjusted with a socket head screw M8.

STANDARD EXECUTIONS
- **PBL-H**: fixed bracket, without brake.
- **SBL-H**: turning plate bracket, without brake.
- **SBF-H**: turning plate bracket, with brake.

APPLICATIONS
Suitable for heavy industrial applications. Excellent wear and tearing resistance. For further information see RE.F8 on page 1983.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

RE.F8-WH

RoHS | 6500 - 9000 N

Technopolymer wheels

Electro-welded steel bracket for heavy loads

WHEEL CENTRE BODY
Polyamide-based (PA) technopolymer.

ROLLING ACTION
Hub with ball bearings. Ideal solution for heavy loads and continuous moving.

FIXED PLATE BRACKET
Electrolytically zinc-plated electro-welded steel. The bracket is designed to withstand loads up to 9000N and ensures capacities that make it suitable for heavy industrial applications and for severe conditions of use, such as impact and high speeds.

TURNING PLATE BRACKET
Electrolytically zinc-plated electro-welded steel. The presence of an axial bearing and a conical bearing ensures excellent manoeuvrability also at full load and increases the resistance of the bracket against side impact. It is equipped with lubricator and anti-loosening system of the locking nut. The bracket is designed to withstand loads up to 9000N. Suitable for heavy industrial applications and for severe conditions of use, such as impact and high speeds.
It consists of (see fig. 1):
1. fitting plate: forged steel with built-in pin, electrolytically zinc-plated;
2. fork: drawn sides electro-welded to the flange, electrolytically zinc-plated;
3. rotation system: axial ball bearing and conical roller bearing;
4. lubricator;
5. anti-loosening system of the locking nut.

BRAKE
Dual-effect rear brake with simultaneous locking of wheel and bracket. The brake is simple and effective to use: it is actuated and released by a simple action from the top downward at the tip of two separate pedals, thus ensuring the utmost manoeuvring comfort. The braking efficacy may be adjusted with a socket head screw M8.

STANDARD EXECUTIONS
- **PSL-WH**: fixed plate bracket, without brake.
- **SSL-WH**: turning plate bracket, without brake.
- **SSF-WH**: turning plate bracket, with brake.

APPLICATIONS
Suitable for heavy industrial applications, due to loads up to 7500N. Excellent wear and tearing resistance. For further information see RE. F8 on page 1983.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

RE.F7-N-HT

INOX STAINLESS STEEL | RoHS | HT | 1500 - 2000 N

Duroplast wheels

Steel or stainless steel sheet bracket, high temperatures

WHEEL CENTRE BODY

Phenolic based (PF) Duroplast monolithic wheel, resistant to temperatures up to 300°C.

ROLLING ACTION

Hub with steel or stainless steel tube (SST executions) and PTFE bosses.

TURNING PLATE BRACKET

Zinc-plated steel or AISI 304 stainless steel (SST version) sheet, the bracket is designed to withstand loads up to 2000N. The presence of a double ball race turns and the direct contact between the plate and the ball race ring with built-in pin ensure excellent manoeuvrability. Does not require maintenance. It consists of (see Fig.1):

1. fitting plate: electrolytically zinc-plated steel or AISI 304 stainless steel sheet;
2. fork: electrolytically zinc-plated steel or AISI 304 stainless steel sheet;
3. ball race ring: electrolytically zinc-plated steel or AISI 304 stainless steel sheet;
4. central pin: incorporated in the plate, cold reflanged;
5. rotation system: dual ball ring, high temperature grease-lubricated;
6. dust seal: RAL 7015 dark grey technopolymer.

STANDARD EXECUTIONS

- **SBL**: turning plate bracket, without brake.
- **FBL**: turning plate bracket and centre pass-through hole, without brake.

Index for bracket material:

- **N**: zinc-plated steel plate bracket.
- **N-SST**: AISI 304 stainless steel bracket.

APPLICATIONS

Being resistant to high temperatures, RE.F7-N-HT wheel is particularly suitable for use in food industries and cooking ovens, especially in the baking sector.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

RoHS 700 - 1800 N

Thermoplastic rubber wheels

Technopolymer centre body

COVERING
Grey anti-trace thermoplastic wheel, hardness 85 Shore A.

WHEEL CENTRE BODY
Polypropylene-based technopolymer (PP).

ROLLING ACTION
Hub with pass-through hole.

APPLICATIONS
Excellent smoothness and elasticity features. For selection parameters see Technical Data on page 2013.
RE.G1 wheels are also supplied with steel sheet bracket (RE.G1-N on page 1993).

ENVIRONMENTAL CONDITIONS
Suitable for use in humid environments and in the presence of medium-aggressive chemicals; use in environments with the presence of organic, chlorinated solvents, hydrocarbons and mineral oils is not recommended.

ROLLING RESISTANCE - FORCE / LOAD APPLIED
The diagram shows the force to be applied to a wheel to keep it moving at the constant speed of 4 km/h, according to the applied load.
The intersection point with a 50N value is the maximum transportable load with a manually actuated 4-wheel trolley; in fact, 200N = 50N x 4 wheels is the maximum force that may be supported by the operator according to the regulations in force regarding work safety.

MECHANICAL MOVING WITH TOWING DEVICES
For mechanical towing, please see the technical specifications to determine the capacity variation.

TEMPERATURE
If operating temperatures in an application differ from the standard range of values, please see the technical specifications to determine the capacity variation.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

Vulcanised rubber wheels

Technopolymer centre body

COVERING WITH TREAD
Vulcanised rubber; hardness 83 Shore A.

WHEEL CENTRE BODY
Polypropylene-based technopolymer (PP).

ROLLING ACTION
Hub with pass-through hole.

APPLICATIONS
RE.E2 wheels may be mounted on different kinds of trolleys, with medium-light loads; it is also suitable for outdoor use. Typical applications: trolleys for industrial moving, for outdoor use also, waste dumpsters. For selection parameters see Technical Data on page 2013.
RE.E2 wheels are also supplied with steel sheet bracket (RE.E2-N on page 1996).

ENVIRONMENTAL CONDITIONS
Suitable for use in humid environments and in the presence of atmospheric agents; use in environments with the presence of organic, chlorinated solvents, hydrocarbons and mineral oils is not recommended.

ROLLING RESISTANCE - FORCE / LOAD APPLIED
The diagram shows the force to be applied to a wheel to keep it moving at the constant speed of 4 km/h, according to the applied load.
The intersection point with a 50N value is the maximum transportable load with a manually actuated 4-wheel trolley; in fact, 200N = 50N x 4 wheels is the maximum force that may be supported by the operator according to the regulations in force regarding work safety.

MECHANICAL MOVING WITH TOWING DEVICES
For mechanical towing, please see the technical specifications to determine the capacity variation.

TEMPERATURE
If operating temperatures in an application differ from the standard range of values, please see the technical specifications to determine the capacity variation.

Vulcanised rubber wheels

Steel sheet bracket

COVERING WITH TREAD
Vulcanised rubber; hardness 83 Shore A.

WHEEL CENTRE BODY
Polypropylene-based (PP) technopolymer.

ROLLING ACTION
Hub with pass-through hole.

FIXED PLATE BRACKET
Zinc-plated steel sheet, the bracket is designed to withstand loads up to 3000N.

TURNING PLATE BRACKET
Zinc-plated steel sheet, the bracket is designed to withstand loads up to 3000N. The presence of a double ball race and the direct contact between the plate and the ball race ring with built-in pin ensure excellent manoeuvrability. Does not require maintenance.
It consists of (see Fig.1):
1. fitting plate: electrolytically zinc-plated steel sheet;
2. fork: electrolytically zinc-plated steel sheet;
3. ball race ring: electrolytically zinc-plated steel sheet;
4. central pin: incorporated in the plate, cold reflanged;
5. rotation system: dual grease-lubricated ball race;
6. dust seal: RAL 7015 dark grey technopolymer.

BRAKE
Total brake that locks the wheel and bracket rotation.
The optimised dimensions and the retractable pedal ensure minimal space occupied and maximum actuation ease.
Hardened carbon steel spring.

STANDARD EXECUTIONS
- **PBL-N**: fixed plate bracket, without brake.
- **SBL-N**: turning plate bracket, without brake.
- **SBF-N**: turning plate bracket, with brake.
- **FBL-N**: turning plate bracket and centre pass-through hole, without brake.
- **FBF-N**: turning plate bracket and centre pass-through hole, with brake.

APPLICATIONS
RE.E2 wheels may be mounted on different kinds of trolleys, with medium-light loads; it is also suitable for outdoor use.
Typical applications: trolleys for industrial moving, for outdoor use also, waste dumpsters.
For further information see RE.E2 on page 1995.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

Vulcanised rubber wheels

Steel centre body

COVERING WITH TREAD
Vulcanised rubber; hardness 83 Shore A.

WHEEL CENTRE BODY
Consisting of two zinc-plated and riveted plate disks.

ROLLING ACTION
Polyamide-based technopolymer (PA) hub and boss, integral to the wheel centre body.

APPLICATIONS
RE.E3 wheels may be mounted on different kinds of trolleys, with medium-light loads; it is also suitable for outdoor use. Typical applications: trolleys for industrial moving, for outdoor use also, waste dumpsters. For selection parameters see Technical Data on page 2013. RE.E3 wheels are also supplied with steel sheet bracket for medium-heavy loads (RE.E3-N on page 1999).

ENVIRONMENTAL CONDITIONS
Suitable for use in humid environments and in the presence of atmospheric agents; use in environments with the presence of organic, chlorinated solvents, hydrocarbons and mineral oils is not recommended.

ROLLING RESISTANCE - FORCE / LOAD APPLIED
The diagram shows the force to be applied to a wheel to keep it moving at the constant speed of 4 km/h, according to the applied load.
The intersection point with a 50N value is the maximum transportable load with a manually actuated 4-wheel trolley; in fact, 200N = 50N x 4 wheels is the maximum force that may be supported by the operator according to the regulations in force regarding work safety.

MECHANICAL MOVING WITH TOWING DEVICES
For mechanical towing, please see the technical specifications to determine the capacity variation.

TEMPERATURE
If operating temperatures in an application differ from the standard range of values, please see the technical specifications to determine the capacity variation.

RE.E3-N

RoHS 650 - 2300 N

Vulcanised rubber wheels

Steel sheet bracket

COVERING WITH TREAD
Vulcanised rubber; hardness 83 Shore A.

WHEEL CENTRE BODY
Consisting of two zinc-plated and riveted sheet disks.

ROLLING ACTION
Polyamide-based technopolymer (PA) hub and boss, integral to the wheel centre body.

FIXED PLATE BRACKET
Zinc-plated steel sheet, the bracket is designed to withstand loads up to 3000N.

TURNING PLATE BRACKET
Zinc-plated steel sheet, the bracket is designed to withstand loads up to 3000N. The presence of a double ball race turns and the direct contact between the plate and the ball race ring with built-in pin ensure excellent manoeuvrability. Does not require maintenance.
It consists of (see Fig.1):
1. fitting plate: electrolytically zinc-plated steel sheet;
2. fork: electrolytically zinc-plated steel sheet;
3. ball race ring: electrolytically zinc-plated steel sheet;
4. central pin: incorporated in the plate, cold reflanged;
5. rotation system: dual grease-lubricated ball race;
6. dust seal: RAL 7015 dark grey technopolymer.

BRAKE
Total brake that locks the wheel and bracket rotation.
The optimised dimensions and the retractable pedal ensure minimal space occupied and maximum actuation ease.
Hardened carbon steel spring.

STANDARD EXECUTIONS (BORE WITH PLAIN BEARING)
- **PBL-N**: fixed plate bracket, without brake.
- **SBL-N**: turning plate bracket, without brake.
- **SBF-N**: turning plate bracket, with brake.
- **FBL-N**: turning plate bracket and centre pass-through hole, without brake.
- **FBF-N**: turning plate bracket and centre pass-through hole, with brake.

APPLICATIONS
RE.E3 wheels may be mounted on different kinds of trolleys, with medium-light loads; it is also suitable for outdoor use. Typical applications: trolleys for industrial moving, for outdoor use also, waste dumpsters.
For further information see RE.E3 on page 1998.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

Elastic rubber wheels

Aluminium centre body

COVERING
Elastic rubber, hardness 70 Shore A.

WHEEL CENTRE BODY
Pressure die-cast aluminium.

ROLLING ACTION
Hub with ball bearings. Ideal solution for heavy loads and continuous moving.

APPLICATIONS
Wear and tearing resistance. For selection parameters see Technical data on page .
RE.G2 wheels are also supplied with steel sheet bracket for medium-heavy loads (RE.G2-H on page 2002).

ENVIRONMENTAL CONDITIONS
Suitable for use in humid environments and in the presence of medium-aggressive chemicals; use in environments with the presence of organic, chlorinated solvents, hydrocarbons and mineral oils is not recommended.

ROLLING RESISTANCE - FORCE / LOAD APPLIED
The diagram shows the force to be applied to a wheel to keep it moving at the constant speed of 4 km/h, according to the applied load.
The intersection point with a 50N value is the maximum transportable load with a manually actuated 4-wheel trolley; in fact, 200N = 50N x 4 wheels is the maximum force that may be supported by the operator according to the regulations in force regarding work safety.

MECHANICAL MOVING WITH TOWING DEVICES
For mechanical towing, please see the technical specifications to determine the capacity variation.

TEMPERATURE
If operating temperatures in an application differ from the standard range of values, please see the technical specifications to determine the capacity variation.

RoHS 1800 - 5000 N

Elastic rubber wheels

Steel sheet bracket for medium-heavy loads

COVERING
Elastic rubber, hardness 70 Shore A.

WHEEL CENTRE BODY
Pressure die-cast aluminium.

ROLLING ACTION
Hub with ball bearings. Ideal solution for heavy loads and continuous moving.

FIXED PLATE BRACKET
Yellow zinc-plated steel sheet (test in saline fog chamber above 72h). The bracket is designed to withstand loads up to 7500N. It ensures capacities that make it suitable for heavy industrial applications.

TURNING PLATE BRACKET
Yellow zinc-plated steel sheet (test in saline fog chamber above 72h). The presence of a double ball race and the direct contact between the plate and the ball race ring with built-in pin ensure excellent manoeuvrability. Does not require maintenance. The bracket is designed to withstand loads up to 7500N. It ensures capacities that make it suitable for heavy industrial applications.
It consists of (see Fig.1):
1. fitting plate: yellow zinc-plated steel sheet;
2. fork: yellow zinc-plated steel sheet;
3. ball race ring: yellow zinc-plated steel sheet;
4. central pin: class 8.8 steel screw and steel nut;
5. rotation system: dual grease-lubricated ball race;
6. dust seal: RAL 7015 dark grey technopolymer.

BRAKE
Dual-effect rear brake with simultaneous locking of wheel and bracket. The brake is simple and effective to use: it is actuated and released by a simple action from the top downward at the tip of two separate pedals, thus ensuring the utmost manoeuvring comfort. The braking efficacy may be adjusted with a socket head screw M8.

STANDARD EXECUTIONS
- **PSL-H**: fixed bracket, without brake.
- **SSL-H**: turning plate bracket, without brake.
- **SSF-H**: turning plate bracket, with brake.

APPLICATIONS
Wear and tearing resistance.
For further information see RE.G2 on page 2001.

For rolling resistance and dynamic carrying capacity see Technical Data on page 2014.

RoHS 400 - 700 N

Wheels for the general public

Injected polyurethane covering

COVERING
Injected polyurethan, hardness 55 Shore D.

WHEEL CENTRE BODY
Polyamide-based technopolymer (PA).

ROLLING ACTION
Hub with pass-through hole.

FIXED PLATE BRACKET
Electrolytically zinc-plated steel sheet bracket.

TURNING PLATE BRACKET
Electrolytically zinc-plated steel sheet bracket.
The presence of a double ball race and the direct contact between the plate and the ball race ring with built-in pin ensure excellent manoeuvrability.

FRONT-ACTUATED BRAKE
Total brake that locks the wheel and bracket rotation. The optimised dimensions and the retractable pedal ensure minimal space occupied and maximum actuation ease.

STANDARD EXECUTIONS
- **PBL**: fixed plate bracket, without brake.
- **SBL**: turning plate bracket, without brake.
- **SBF**: turning plate bracket, with brake.
- **CBL**: turning plate bracket and threaded centre pin, without brake.
- **CBF**: turning plate bracket and threaded centre pin, with brake.
- **FBL**: turning plate bracket and centre pass-through hole, without brake.
- **FBF**: turning plate bracket and centre pass-through hole, with brake.

APPLICATIONS
Wheels for the general public, excellent smoothness and elasticity features, high wear and tearing resistance.

ENVIRONMENTAL CONDITIONS
Suitable for use in industrial and institutional environments, even in the presence of moisture and chemical agents.
The good resistance to frequent cleaning cycles makes it suitable for environments where it is necessary to ensure hygiene.

RE.C6-G

RoHS 1400 N

Twin wheels for the general public

Injected polyurethane covering

COVERING
Injected polyurethan, hardness 55 Shore D.

WHEEL CENTRE BODY
Polyamide-based technopolymer (PA).

ROLLING ACTION
Hub with pass-through hole.

TURNING PLATE BRACKET
Electrolytically zinc-plated steel sheet bracket.
The presence of a double ball race and the direct contact between the plate and the ball race ring with built-in pin ensure excellent manoeuvrability.

FRONT-ACTUATED BRAKE
Total brake that locks the wheel and bracket rotation. The optimised dimensions and the retractable pedal ensure minimal space occupied and maximum actuation ease.

STANDARD EXECUTIONS
- **SBL-G**: turning plate bracket, without brake.
- **SBF-G**: turning plate bracket, with brake.
- **CBL-G**: turning plate bracket and threaded centre pin, without brake.
- **CBF-G**: turning plate bracket and threaded centre pin, with brake.
- **FBL-G**: turning plate bracket and centre pass-through hole, without brake.
- **FBF-G**: turning plate bracket and centre pass-through hole, with brake.

APPLICATIONS
Wheels for the general public with high carrying capacity, excellent smoothness and elasticity features, good wear and tearing resistance.

ENVIRONMENTAL CONDITIONS
RE.C6 twin wheels are suitable for use in industrial and institutional environments, even in the presence of moisture and chemical agents. The good resistance to frequent cleaning cycles makes it suitable for environments where it is necessary to ensure hygiene.

RoHS 350 - 550 N

Wheels for the general public

Vulcanised rubber coating

COVERING
Grey anti-trace vulcanised rubber.

WHEEL CENTRE BODY
Polyamide based (PA) technopolymer.

ROLLING ACTION
Hub with pass-through hole.

FIXED PLATE BRACKET
Electrolytically zinc-plated steel sheet bracket.

TURNING PLATE BRACKET
Electrolytically zinc-plated steel sheet bracket.
The presence of a double ball race and the direct contact between the plate and the ball race ring with built-in pin ensure excellent manoeuvrability.

FRONT-ACTUATED BRAKE
Total brake that locks the wheel and bracket rotation. The optimised dimensions and the retractable pedal ensure minimal space occupied and maximum actuation ease.

STANDARD EXECUTIONS
- **PBL**: fixed plate bracket, without brake.
- **SBL**: turning plate bracket, without brake.
- **SBF**: turning plate bracket, with brake.
- **CBL**: turning plate bracket and threaded centre pin, without brake.
- **CBF**: turning plate bracket and threaded centre pin, with brake.
- **FBL**: turning plate bracket and centre pass-through hole, without brake.
- **FBF**: turning plate bracket and centre pass-through hole, with brake.

APPLICATIONS
Wheels for the general public, excellent rolling resistance and elasticity features.

ENVIRONMENTAL CONDITIONS
Suitable for use in humid environments and in the presence of medium-aggressive chemical environments; use in environments with the presence of organic, chlorinated solvents, hydrocarbons and mineral oils is not recommended.

For dynamic carrying capacity see Technical Data on page 2014.

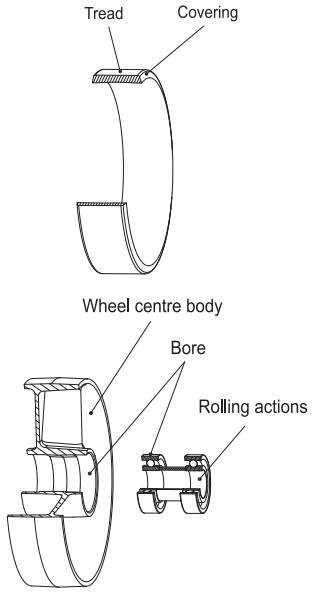
1. GENERAL INFORMATION



The wheel is a mechanical assembly in which sliding motion is replaced by rolling motion through rotation around an axis. The wheel consists of the following components:
the tread, the covering, the wheel centre body, the bore and the rolling action.

- **Tread**

The tread is the wheel's outer surface, i.e. the part that comes in contact with the ground. It can be smooth or engraved with raised patterns to increase its grip on the ground.

- **Covering**

The covering, or rolling strip, is the outer ring. It is made of different materials and characterises the wheel. The covering is fixed when joined with the wheel centre body as a single solid piece (using an adhesive or through a mechanical connection) or fitted when mechanically assembled on the wheel centre body.

- **Wheel centre body**

The wheel centre body is the wheel part that connects the covering to the bore. It comes in various shapes and is made of different materials; it can be a single piece or two or more parts joined together.

- **Bore and rolling actions**

The bore is the middle part of the wheel that houses the axle or the rolling actions that make rotation easier (ball bearings, roller bearings, plain bearings, etc.).
Depending on the construction methods and materials forming the covering, wheels can be divided into three families: rubber wheels, polyurethane wheels and monolithic (or hard tread) wheels.

1.1 Rubber wheels

A rubber wheel covering consists of an elastomer made from natural and/or synthesised rubber. The rubber used to build industrial wheels can be vulcanised or injection moulded.

- **Vulcanised rubber:** special mineral loads and vulcanising agents are added to the rubber that under goes a process called "vulcanising". During this process, the rubber's molecular structure changes significantly: the "pasty" material at the beginning of the process becomes a non-fusible product that acquires and, over time, maintains the form of the mould in which the reaction occurs. The ring obtained is mechanically assembled to the wheel centre body. Vulcanised rubber has enhanced elastic deformability properties within relatively broad ranges of applied traction and compression loads. The physical-mechanical characteristics of vulcanised rubber vary according to the quality of the natural and/or synthesised rubber used, the type and quantity of mineral loads added and the conditions under which the vulcanisation process takes place.

- **Injected rubber:** the rubber goes through a chemical synthesis process. The material obtained is injected into a mould in which the wheel centre body has already been inserted. The injected rubber maintains its fusibility even after moulding. Normally, the elastic properties of injected rubber are worse than those of the best quality vulcanised rubber, even though they are comparable to those of medium and low-quality vulcanised rubber. The following are some of the main physical-mechanical parameters relative to the quality of rubber (for the definition of each parameter see the standards indicated next to that parameter):

  – hardness UNI EN ISO 868:1999; ASTM D 2240-2004
  – specific density UNI 7092:1972; ISO 2781:1988
  – impact strength UNI 7716:2000; ISO 4662:1986
  – abrasion loss UNI 9185:1988; DIN 53516:1987
  – ultimate tensile strength UNI 6065:2001; ISO 37:1994; ASTM D 412c-1998
  – ultimate elongation UNI 6065:2001; ISO 37:1994; ASTM D 412c-1998
  – tearing resistance UNI 4914:1987; ASTM D 624b-2000
  – compression set UNI ISO 815:2001

These parameters are not independent; in other words, changing one of them usually leads to a change in other parameters (to varying degrees). Hardness is the easiest parameter to determine: in general, increased hardness reduces the elastic properties (impact strength, ultimate elongation, compression set) and lowers overall wheel performances. Instead, parameters such as tearing resistance and abrasion loss depend mainly on the composition of the vulcanised rubber and, to a lesser extent, on hardness.

1.2 Polyurethane wheel

A polyurethane wheel covering consists of an elastomer obtained exclusively from the synthesis of raw materials. Polyurethanes are chemical compounds obtained from a polymerisation reaction triggered by mixing two components, belonging to two different families of compounds (Di-Isocyanates and Polyalcohols), that were previously heated to temperatures that keep them in the liquid state with relatively low viscosity. In general, elastomer polyurethanes do not contain any additional mineral loads. The reactive mix is cast or injected into heated moulds containing the metal or plastic centres. Thanks to the temperature of the mould and of the wheel centre body, the polymerisation reaction can be completed inside the polyurethane, while the polyurethane is chemically linked to any adhesive that may be present on the surface of the wheel centre body.

- **Mould-on polyurethane** is no longer fusible, has good elasticity characteristics in addition to medium-high hardness and compression and traction strength.

- **Injected polyurethane** is fusible even after moulding; in general, it has inferior elasticity characteristics but superior hardness with respect to mould-on polyurethane.

- The following are some of the main physical-mechanical characteristics of polyurethane (for the definition of each characteristic see the standards indicated next to that parameter):

– durezza UNI EN ISO 868:1999; ASTM D 2240-2004
– densità specifica UNI 7092:1972; ISO 2781:1988
– resilienza UNI 7716:2000; ISO 4662:1986
– perdita per abrasione UNI 9185:1988; DIN 53516:1987
– carico di rottura a trazione UNI 6065:2001; ISO 37:1994; ASTM D 412c-1998
– allungamento a rottura trazione UNI 6065:2001; ISO 37:1994; ASTM D 412c-1998
– resistenza alla lacerazione UNI 4914:1987; ASTM D 624b-2000
– compression set UNI ISO 815:2001.

1.3 Monolithic (hard tread) wheels

In monolithic (hard tread) wheels, the wheel centre body and the covering are made with the same material. The physical-mechanical characteristics of the wheel will change depending on the material used.

2. BRACKETS

The bracket is the part that connects the wheel to the equipment. Normally, all wheels need a bracket to be applied to the equipment; an exception is made for wheels whose axle is built into the equipment. Brackets can be the swivel or the fixed type.
ELESA wheels are coupled to various types of bracket made out of zinc-plated steel sheet, AISI 304 stainless steel or electro-welded steel described in detail in the respective product data sheets.
The description of the brackets made out of steel sheet follows by way of example.

2.1 Swivel bracket

The swivel bracket rotates around its own vertical axis as the running direction changes. The wheel axis is misaligned with respect to the bracket axis so that it is easier to manoeuvre the equipment. "Manoeuvrability" is defined as the ability of the equipment to change direction, while "directionality" refers to the equipment's ability to maintain a trajectory along a specific direction. Excessive offset reduces equipment directionality due to "sliding" of the wheel (the "Swimmy" effect). Swivel brackets can also be equipped with brakes. The swivel bracket consists of a connecting plate, a fork, a ball race ring, swivel actions, a central pin and, if necessary, a dust seal.

• **Fitting plate**

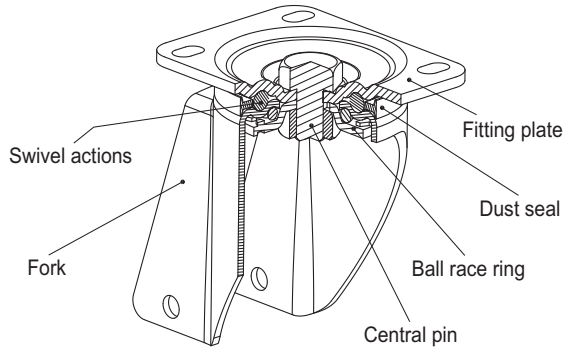
The fitting plate is used to connect the bracket to the equipment (four connection holes).

• **Wheel support fork**

The fork is the piece with the characteristic upside-down "U" shape that supports the wheel. Holes are drilled at the bottom to house the wheel's axle set, while the swivel actions are inserted in the top.

• **Ball race ring**

The ball race ring contains the castor's swivel actions.
In special cases, it can also be used only as a dust seal or a guard.



• **Swivel actions**

Swivel actions allow the plate to rotate on the fork. They consist of a ring of balls in contact between the plate and the fork (called "ball gyro") lubricated with grease to protect against dust, liquids and other aggressive agents. The bracket load capacity varies significantly according to the type of swivel action being used.

• **Central pin**

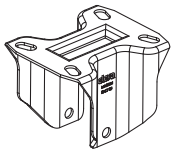
The central pin is the part that joins the plate and the ball race ring. Thanks to the central pin, the plate and the ball race ring form a single piece, while the fork is free to rotate around its own axis. The pin can:
– be incorporated in the plate, through forming and riveting after assembling the parts;
– be incorporated in the plate, through hot forming on the plate and tightening with a self-locking nut;
– consist of a screw and a nut.

• **Dust seal**

The dust seal protects the swivel actions of the bracket against dust and solid and medium-grain aggressive agents.

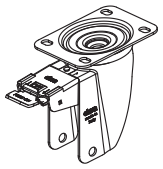
2.2 Fixed bracket

The fixed bracket is designed to keep the wheel moving in a specific direction; therefore, it guarantees equipment directionality. Instead, equipment manoeuvrability depends on the use of swivel brackets. In general, the fixed bracket consists of a single pressed steel plate shaped into an upside-down "U". Holes to house the wheel axle set are drilled at the bottom, while the equipment attachment holes are at the top.



2.3 Swivel bracket with brake

The brake is the device that allows the blocking of the rotation of the bracket around its axis, of the rotation of the wheel and of the rotation of the castor (wheel+bracket assembly).



3. AXLE SET

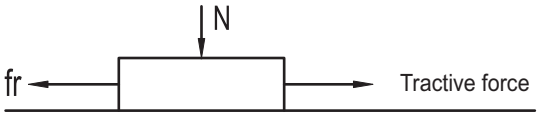
The axle set is the piece used to connect the wheel to the castor. Normally, it consists of a threaded pin with nut, washers, tube and, where necessary, spacers. For standard applications, the axle set can be riveted directly on the castor fork.

4. LOADS, FRICTION AND FORCES

Dissipative forces or friction occur along the contact surfaces between bodies and tend to oppose the movement.

4.1 Sliding friction

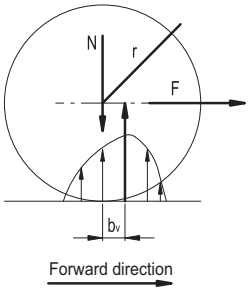
Sliding friction force opposes the movement between two contact surfaces that slide against each other. This force depends on the type of contact surfaces (materials and finishing level) and on the load applied in the direction perpendicular to the motion direction (Normal force).



In mathematical terms, the sliding friction force is defined as follows:
Fr=br x N where: **br** = sliding friction coefficient **N** = normal force (or load)

If two bodies are initially stationary, the resistance force is called the static friction force and represents the minimum force that must be applied to start moving the two bodies. When the two bodies are in relative motion, a force lower than the static friction force is sufficient to keep the speed constant: this is called the dynamic friction force. The friction coefficient is obtained experimentally for both static friction and dynamic friction.

4.2 Rolling friction



Rolling friction force is generated when two bodies roll on each other without sliding. Let's imagine a wheel with **radius r** subjected to a **load N**. As the wheel approaches the contact point, the material is compressed and afterwards, once the contact point has been surpassed, undergoes an elastic release. If the material used to manufacture the wheel is not perfectly elastic, some of the energy required for compression is lost in the subsequent return phase – dissipated in the form of heat to counteract internal frictional resistance of the material. If we think in terms of forces, instead of energies, we could say that the distribution of pressure in the contact is not symmetrical compared to the direction of force N. The diagram of pressure generates, therefore, a resultant equal to N but moved forward with respect to the wheel axis by a distance bv (arm of the rolling friction). The displacement of the resultant generates a moment of resistance. To keep the wheel turning evenly it is necessary to apply a motive moment identical to and opposite **Mr** or a **traction force F** parallel to the forward direction and such that.
From the previous formulas we obtained:

$$F = \frac{M_r}{r} = \frac{b_v \times N}{r} = f_v \times N$$

Where:

$$f_v = \frac{b_v}{r}$$

With **fv** known as the **rolling friction coefficient** which can be found with experimental tests.

4.3 Tractive force

Tractive force is the force needed to overcome the resistance caused by friction when two bodies slide or roll on each other. Compared to the resistance generated by friction, tractive force has the same intensity and the same sense, but the opposite direction. The lower the force needed to keep a equipment moving, the greater the smoothness of the wheel applied to the moving equipment. In the specific case of a wheel rolling on a flat surface, the tractive force must overcome the resistance caused by rolling friction - that arises when the wheel comes in contact with the surface - and by sliding friction - generated by the mechanical bore and axle set coupling.

5. CHOOSING THE RIGHT WHEEL

Any product that isn't used under the conditions for which it was designed may not satisfy the user's needs. It may also damage materials and cause injuries. Here are some examples in which wheels and castors are used incorrectly:

- using a wheel not suitable for the floor will deteriorate the wheel covering and damage the floor;
- choosing a fixed castor under operating conditions for which a equipment must be vey manoeuvrable will make it extremely difficult to move that equipment;
- applying a load that exceeds the wheel's rated load capacity will lead to wheel malfunctions and premature deterioration.

Therefore, a technical analysis of the operating conditions must be performed. The most economical solution should be chosen only after the product has been technically evaluated. The purpose of performing a technical analysis on a equipment moving solution is to define the operating conditions and any external factors that may affect equipment use. The following factors must be analysed in order to choose the right wheel:

- **nature and condition of the ground (5.1)**
- **environment (5.2)**
- **magnitude and nature of the load (5.3)**
- **speed and means of traction (5.4)**
- **manoeuvrability (5.5)**
- **diagrams (5.6)**

The process of choosing the right wheel to match the operating conditions can be divided into three steps: **step one:** identifying the correct type of wheel based on the floor and the characteristics of the operating environment; **step two:** calculating the dynamic capacity, static load and rolling resistance required by the specific application and, therefore, determining the wheel diameter; **step three:** identifying the correct bracket and checking the dynamic capacity of the castor (wheel+bracket assembly). If the evaluation of these various aspects generates different data with reference to the same wheel and/or castor characteristic, the final choice must be made based on the most conservative condition.

- **Static load[N]**

Static load is the maximum load that a motionless (stationary) wheel can support without generating any permanent deformations that may reduce its operating efficiency. A wheel mounted on a equipment that is seldom moved, and therefore almost always remains in the same position, is defined as being subjected to a static load.

- **Dynamic carrying capacity**

Dynamic carrying capacity of a wheel is defined as the value (expressed in N) of the maximum load that can be supported by that wheel in conformity with ISO 22883:2004 and UNI EN 12532:2001 that, for industrial wheels, require dynamic testing under the following conditions:

- constant speed of 1.1 m/s (4 km/h)
- overcoming 500 obstacles and 15,000 revolutions of the diameter;
- obstacles with width 100 mm and height 5% of the wheel diameter with an elastic rolling strip (hardness up to 90 Shore A) and 2.5% of the diameter for wheels with a rigid rolling strip (hardness greater than 90 Shore A);
- temperature 20 °C (tolerance ± 10 °C);
- non-continuous operation (3 minutes of operation and 1 minute stopped);
- smooth, hard and horizontal floor.

- **Rolling resistance**

Rolling resistance is the value (expressed in N) of the maximum load that can be supported by each single wheel at a constant speed of 4 km/h with application of a tractive force or thrust equal to 50N (excluding the initial pickup). This value is obtained by applying a tractive force of 200N to a 4-wheeled equipment and measuring the magnitude of the maximum transportable load per wheel during normal moving conditions. The applied tractive force of 200N complies with the international workplace standard for indoor moving and is universally recognised as the human fatigue limit that can be supported for extended periods of time.

5.1 Nature and condition of the ground

The nature and condition of the ground and the presence of any obstacles will havean influence on choosing the right wheel. They are also important factors affecting the performance of the moving equipment as well as the efficiency and the duration of the wheels and castors. Special attention is required for cases involving uneven floors or where obstacles are present. In this case, the impact of the wheel against an obstacle generates advancement resistance whose magnitude depends on the elasticity of the rolling strip material. In fact, the energy absorbed during an impact is greater in a wheel with an elastic rolling strip than in a rigid wheel, thus partially cancelling the braking effects caused by the obstacle. For floors that are uneven or on which obstacles are present, with load capacity being equal, a wheel with a greater diameter should be chosen in order to overcome the obstacle. The wheel must be chosen very carefully in all cases in which there are obstacles, chemical and/or organic substances and machining residues. The main types of flooring are: tiles, asphalt, cement-resin, not paved floor, expanded metal floor, floor with chips, obstacles etc.
The main floor-wheel covering combinations are listed in the following table.

Floor type	Suitable covering
Tiles	Polyurethane or rubber
Asphalt	Rubber
Cement-resin	Polyurethane or rubber
Not paved	Rubber
Expanded metal	Rubber
With chips/obstacles	Rubber

5.2 Environment

To choose the right wheel, it's also important to determine if the wheel materials are compatible with the chemical-environmental conditions, the temperature, the humidity and the inductive electrostatic phenomena that may affect wheel operation. The standard operating conditions are indicated in the manufacturer's catalogue for each type of wheel.

Chemical-environmental conditions

Because there are so many different types of aggressive chemical agents in work environments, it's difficult to provide a complete and exhaustive description.The main chemical substances that a wheel may come in contact with include: weak acids (e.g. boric acid, sulphurous acid), strong acids (e.g. hydrochloric acid, nitric acid), weak bases (e.g. alkaline solutions), strong bases (soda, caustic soda), chlorinated and aromatic solvents (e.g. acetone, turpentine), hydrocarbons (e.g. petrol, oil, diesel oil, mineral oils), alcohol (e.g. ethyl alcohol), fresh water, salt water, saturated steam. Therefore, when choosing a wheel, it's very important to check if the material forming the covering, the wheel centre body, the rolling actions and the bracket is compatible with the specific features of the operating environment. Caution is required in those sectors in which water, acids, bases, steam and other aggressive agents are often present. For example, a polyurethane wheel should be used instead of a tyred wheel in environments with a large quantity of oils, fats and hydrocarbons, while it is recommended to use stainless steel castors in humid environments and in the presence of high saline concentrations.

Temperature

If operating temperatures in an application differ from the standard range of values indicated by the manufacturer, check the resistance of the wheel materials. This not only applies to the rolling strip and the wheel centre body, but also to the type of lubricant used (it may be necessary to contact the manufacturer). The indicative percentages of carrying capacity variation as a function of temperature are shown in the following table.

Temperature range [°C]		**Carrying capacity variation coefficient (1 = 100% of the carrying capacity)**										
from	to	RE.FF	RE.F2	RE.F5	RE.F4	RE.F7	RE.F8	RE.G1	RE.E2	RE.E3	RE.G2	RE.G5
-40	-20	▲	▲	▲	▲	0,50	0,50	▲	▲	0,40	0,40	▲
-20	0	1,00	1,00	1,00	1,00	1,00	1,00	0,80	1,00	1,00	1,00	1,00
0	+20	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00
+20	+40	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00
+40	+60	0,90	0,90	0,90	0,90	1,00	0,90	0,85	0,85	0,85	0,85	0,90
+60	+80	0,70	0,80	0,80	0,80	1,00	0,70	0,50	0,60	0,60	0,60	0,80
+80	+120	0,40	▲	0,40	0,40	1,00	0,60	▲	▲	▲	0,40	0,40
> 120 °C		▲	▲	▲	▲	1,00	▲	▲	▲	▲	▲	▲

▲ not recommended

The above-mentioned variation values refer to the prolonged and continued use (over 30 minutes) of the wheels at the specified ambient temperatures.

5.3 Magnitude and nature of the load

The magnitude of the load is the value [N] obtained by adding the weight to be transported to the equipment weight (tare). The nature of the load, either a liquid or a solid, has a significant effect on the wheel load capacity calculation. The formula to determine the load capacity for each wheel is:

$$Q = \frac{P_U + P_C}{n}$$

where: **Q** = load capacity for each wheel **Pu** = weight to transport **Pc** = equipment tare (equipment weight) n = number of wheels in contact with the ground

SOLID LOAD

For a solid load, n=3 for a four-wheeled equipment (where three out of four wheels are considered to be in contact with the ground at all times).

LIQUID LOAD

For a liquid load n=2 for a four-wheeled equipment (where two out of four wheels are considered to be alternatively in contact with the ground). A thorough analysis is indispensable when the equipment is

part of an automated or continuous cycle production unit. In this case, all the forces that act on the wheel must be taken into consideration; therefore, it is recommended to include allowances and safety factors.

5.4 Speed and means of traction

Equipment speed is an important factor when choosing a wheel. In fact, if the speed is 0, and thus the use is mainly static, it is enough to compare the load capacity for each wheel with the static load indicated in the manufacturers' catalogues. If the speed is other than 0, then the means of traction must be taken into consideration. The means of traction is the tool used to exert the force that moves the body. In industry, traction devices can be manual or mechanical. Manual moving refers to the situation in which the force is exerted by one or more persons, while mechanical refers to the situation in which such force is exerted by a mechanical device (on-board drives or by using towing devices).

• Manual moving

For manual moving, the speed is generally less than or equal to 4 km/h. Choosing a wheel that allows only one operator to move a load should be based on a wheel rolling resistance value determined by the following formula:

$$S = \frac{P_U + P_C}{n}$$

where: **S** = rolling resistance **Pu** = weight to transport **Pc** = equipment tare (equipment weight) n = number of equipment wheels (maximum 4). The value obtained should be compared to the wheel rolling resistance value indicated in the manufacturer's catalogue.

• Mechanical moving with towing devices

In case of towed mechanical moving, the wheel should be chosen based on the equipment's operating speed. The wheel rated dynamic load capacity normally refers to a speed of no more than 4 km/h (1.1 m/s). If the speed is higher than 4 km/h, a correction factor must be applied to the load capacity value since the materials forming the wheel undergo chemical-physical changes during which their performances decrease with an increase in operating speed. The indicative percentages of load capacity variation with an increase in speed for different types of wheels are shown in the following table.

Speed range [Km/h]		**Carrying capacity variation coefficient (1,00 = 100% of the carrying capacity)**										
min	MAX	RE.FF	RE.F2	RE.F5	RE.F4	RE.F7	FE.F8	RE.G1	RE.E2	RE.E3	RE.G2	RE.G5
0,00	4,00	1,00	1,00	1,00	1,00	1,0	1,00	1,00	1,00	1,00	1,00	1,00

> 16 Km/h		▲	▲	▲	▲	▲	▲	▲	▲	▲	▲	▲

▲ not recommended

• On-board mechanical movement

For equipments with an on-board drive (equipments with drive wheels – self-propelled equipments), the wheels are subjected to particular stress and strain. Besides supporting the load, the drive wheels must transmit the tangent stress that allows the wheel and therefore the equipment to advance. In addition, the drive wheel covering is subjected to even greater stress. In particular, when choosing wheels and castors for self-propelled equipments, the following factors must also be taken into consideration:

- type of plain or ball bearing applied in the bore;
- shaft/bore coupling tolerances;
- bore material in relation to shaft material;
- start and stopping frequency of the motion transmission part;
- direction reversals;
- presence of even temporary overloads.

Since many factors have to be evaluated, it is recommended to contact ELESA S.p.A. to choose the wheels and castors to apply to self-propelled equipments.

5.5 Manoeuvrability

Equipment manoeuvrability refers to the ability of a equipment to be moved more or less easily during use. The limited space available inside some production departments or particularly winding routes that sometimes connect a work unit to another may require special equipment manoeuvrability characteristics to make operator tasks easier. Swivel castors allow the equipment to rotate and the greater the castor offset (i.e. the distance between the bracket rotation axis and the wheel rotation axis), the easier the rotation. However, though it does guarantee excellent manoeuvrability, excessive offset may cause the castor to oscillate along straight routes (Swimmy effect). Fixed castors do not allow the equipment to change direction but do guarantee directionality. In any case, the fixed castors must be mounted so that they are perfectly parallel to each other. The most common wheel layouts along with the relative castors are shown in the following table.

Diagram	Castor layout	Operating conditions	Application examples
	**Stable equipment** two swivel castors and two fixed castors.	Long and straight routes. Few direction changes.	Mechanical workshops, semi-automated warehouses, metallurgical workshops.
	**Stable equipment** four swivel castors.	Short routes. Frequent direction changes. Approach to machines or shelves.	Supermarkets, wood machining companies, small distribution centres.
	**Stable equipment** one swivel castor and two fixed castors	Long and straight routes. Few direction changes.	Small equipments Tool/object carriers Light loads.
	**Tipping equipment** two fixed castors and four swivel castors.	Long routes with mechanical towing. Few direction changes.	Moving in railway, postal, airport areas. Heavy loads.
	**Tipping equipment** four fixed castors.	Long and straight routes without direction changes.	Assembly or machining lines with round trip and head transfer device.
	**Tipping equipment** two fi xed castors and two swivel castors.	Long routes with manual or mechanical towing. Few direction changes.	Mechanical and metallurgical workshops, semi-automated warehouses.

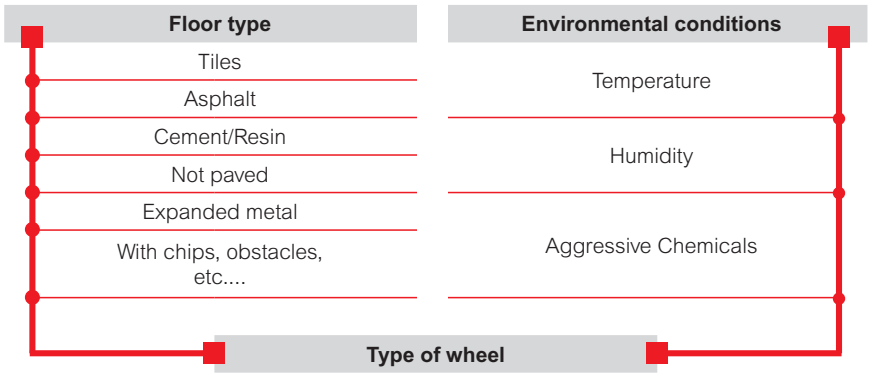
5.6 Choosing the wheel

Each of the parameters and operating characteristics outlined in the previous paragraphs is used in one of the three steps involved in choosing the wheel.

Step 1

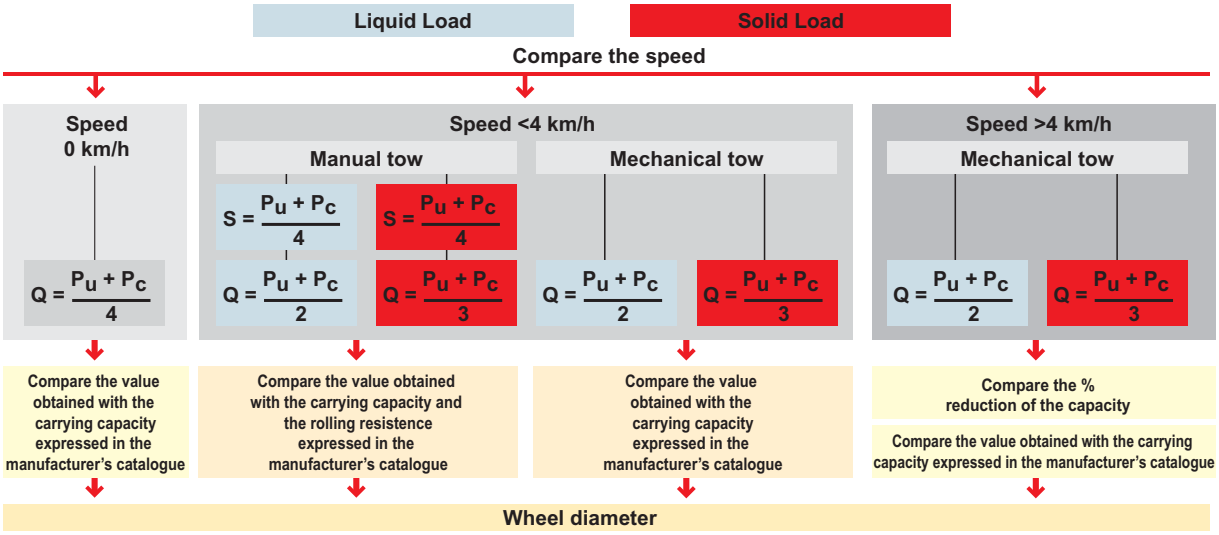
The type of wheel suitable for the floor and operating environment is identified in step 1. The following graph summarizes the factors that influence the choosing of the type of wheel; "type of wheel" means:

- materials that form the covering and the wheel centre body;
- type of anchorage between covering and wheel centre body;
- rolling actions.



Step two

The load capacity, static load and smoothness values required by the specific application and needed to determine the wheel diameter are calculated in step two. One of the most important parts of this step is an analysis of the load that the wheel must support. The following diagram indicates what calculations to perform and what values to consider depending on the various operating conditions. These aspects must always be indicated (magnitude and nature of the load and speed), while ensuring that all the values determined are not higher than the rated values indicated in the manufacturer's catalogue. If the evaluation of various aspects generates different data with reference to the same wheel characteristic, the final choice must be made based on the most conservative condition.



S = rolling resistance **Q** = load capacity **Pu** = weight to transport **Pc** = equipement weight

Step three

The correct castor is chosen in the third step. The step can be divided into two separate parts:
1. Choosing fixed or swivel brackets, depending on manoeuvrability and directionality needs;
2. Checking the compatibility between dynamic load capacity and rated dynamic load capacity of the wheel and bracket.

The following table summarizes some general indications for choosing the right wheels according to the application's features.

Axle set
Connection through which the wheel is assembled to the castor. Normally, it consists of a threaded pin with nut, washers, tube and, where necessary, spacers.
Reference standards: UNI EN 12526:2001 - ISO 22877:2004

Ball race ring
The part that encloses the castor rolling actions.

Bolt hole
Hole made in the top of the bracket and used to attach the castor to the equipment.
Reference standards: UNI EN 12526:2001 - ISO 22877:2004

Bore
Central part of the wheel designed to house the axle set or the rolling actions that facilitate rotation (ball bearings, roller bearings, plain bearings...).
Reference standards: UNI EN 12526:2001 - ISO 22877:2004

Bracket
Connection part between wheel and equipment. Normally, all wheels must use a bracket to be applied to the equipment; an exception is made for wheels whose axle is built into the equipment. Swivel bracket: rotates around its vertical axis as the operating direction changes; it can be a swivel plate bracket, swivel bracket with through hole or swivel bracket with stem. The swivel bracket can be equipped with a brake. Fixed bracket: no rotation; it is designed to keep the wheel moving along a straight line.
Reference standards: UNI EN 12526:2001- ISO 22877:2004

Brake
A device that blocks the rotation of the bracket around its own axis, the wheel rotation or the rotation of the castor (wheel and bracket assembly). Front, rear brakes can be mounted on swivel castors.
Reference standards: UNI EN 12526:2001 - ISO 22877:2004

Central pin
Swivel bracket part that joins the plate, fork and ball race ring; thanks to the central pin, the plate and fork form a single piece, while the ball race ring remains free to rotate around its own axis.

Wheel centre body
The wheel centre body is the wheel part that connects the covering to the bore. It comes in various shapes and is made of different materials; it can be a single piece or two or more parts joined together.
Reference standards: UNI EN 12526:2001 - ISO 22877:2004

Covering
Outer ring of the wheel; it can be made of various materials and characterises the wheel. The covering is fixed when joined with the wheel centre body and is fitted when mechanically assembled on the wheel centre body.

Dynamic carrying capacity
Carrying capacity of a wheel is defined as the value (expressed in N) of the maximum load that can be supported by that wheel in conformity with European UNI EN 12532:2001 and International ISO 22883:2004 standards. Dynamic testing under constant speed (4 km/h, 1.1 m/s) requires overcoming 500 100mm-wide obstacles, with height equal to 5% of diameter for wheels with an elastic rolling strip (hardness up to 90 Shore A) and to 2.5% of the diameter for wheels with a rigid rolling strip (hardness greater than 90 Shore A), without permanent deformation of the wheel affecting its operating efficiency.

Directionality
Possibility of an object to continue moving along a predetermined direction.

Dust seal
The part of the swivel bracket that protects the rolling actions.

Fork
Fixed or swivel bracket part that supports the wheel; normally, it has an upside-down "U" shape. The holes to house the wheel axle set are made at the bottom ends of the fork; the swivel actions are installed in the top.
Reference standards: UNI EN 12526:2001 - ISO 22877:2004

Hardness
Propensity of a material to be penetrated by another material. It is measured with empirical tests that are used to evaluate the magnitude of the penetration of a specific force in the material under specific conditions. The penetration hardness is inversely proportional to the penetration. Different tests can be performed to measure the hardness of a material. Shore A and Shore D durometers are used in some of the most widely used tests: durometer type A is used for the softer materials (elastomers), while type D is used for harder materials (thermoplastic material, polypropylene).
Reference standards: UNI EN ISO 868:1999 - ASTM D 2240-2004

Manoeuvrability
Possibility of an object to easily change its operating direction.

Plate
Top part of the bracket, with holes or slots used for the equipment connection. It can be made in different shapes: rectangular with four fitting holes, square with four fitting holes, triangular with three fitting holes, circular with a bolt hole, circular with a stem.
Reference standard: UNI EN 12526:2001 - ISO 22877:2004

Rolling resistance
Value (expressed in N) of maximum load, applicable for each single wheel that an operator can move, over level paths, even for long periods without fatigue.

Static load
Value (expressed in N) of the maximum load that a stationary wheel can withstand without generating any permanent changes to that wheel.
Reference standards: UNI EN 12527:2001 - ISO 22878:2004

Stem
Vertical end of the castor used to attach the castor into a hole in the equipment.
Reference standards: UNI EN 12526:2001 - ISO 22877:2004

Tearing resistance
Capacity of a material to resist the propagation of a cut. It is measured through a test under the conditions defined in standards ASTM D 624b-2000 - UNI 4914:1987. During that test, a cut perpendicular to the tractive force is made on a test piece placed under traction.

Tread
Wheel external surface; the part of the wheel in contact with the ground. It can be smooth or sculpted with raised patterns to increase its grip on the ground.

Vulcanisation
Treatment with sulphur or sulphurous compounds applied to some substances, including rubber, to eliminate their plastic characteristics and to make them perfectly elastic.

Wheel
A circular mechanical assembly in which sliding motion is replaced by rolling motion through rotation around its own axis. The wheel consists of the following components: the tread, the covering, the wheel centre body, the bore and the rolling action. Depending on the different construction versions and materials used, wheels can be classified into four families: rubber, polyurethane, monolithic (hard tread) and pneumatic.
Reference standards: UNI EN 12526:2001 - ISO 22877:2004

FOR ENGINEERING

18 Retaining magnets

Disc-shaped

Rod-shaped

U-Magnets

Raw magnets

Retaining magnets / Raw magnets

Application / Designs / Structure / Materials of the magnets

Application

Magnets are simple elements that help make solving tasks easier, more efficient, and more reliable.

If drilling is not allowed for fastening, for instance, so as not to damage corrosion protection layers, a retrofit/portable installation is desired, or only a temporary fix is required, this product group offers a large selection of suitable magnets.

Designs

There are seven different magnet types based on a conceptual classification with respect to the shape and function:

Button-type magnets and U-magnets as well as retaining magnets that are disc-shaped or rod-shaped form the largest group along with screws with retaining magnet. The name retaining magnet bears such elements that are used for direct fastening. Raw magnets generally help to structure application-specific magnetic systems.

Structure

Apart from button-type magnets / U-magnets and raw magnets, magnetic systems can also be used. Due to their structure, they have only one magnetic contact surface. Through magnetic return plates, the entire magnetic energy is concentrated on the attracting surface and the spatial effect of the magnetic field is restricted in order to prevent any magnetization of the environment.

Materials of the magnet

Within various designs, various materials of the magnet are available to choose from. In order to meet application-specific conditions in as far as possible, the most important characteristics of the respective materials of the magnet are given in the following table.

Materials of the magnet in comparison

Description	Hard ferrite (HF)	AlNiCo (AN)	SmCo (SC)	NdFeB (ND)
Adhesive force	strong	medium	strong	very strong
Max. working temperature *	≈ 200 °C	≈ 450 °C	≈ 200 °C	≈ 80 °C
Adhesive force on heating	lower	constantly good	lower	lower
Corrosion resistance	very good	very good	good	nickel plated - good
Made from	Iron oxide	Aluminum, nickel, cobalt and iron	Samarium and cobalt	Neodymium, iron and boron
Production method	Sintering	Sintering, casting	Sintering	Sintering
Mechanical properties	very hard, brittle	very hard, tough	very hard, brittle	very hard, brittle
Machineability	not possible	diamond grinding possible	not possible	not possible
Demagnetisation capability	moderate, by demagnetising fields	easy, by demagnetising fields	very difficult, only by large demagnetising	difficult, only by large demagnetising
Price	very reasonable	high	very high	reasonable

* The max. temperature used is only a guide value because it also depends on the dimensions of the magnet.

Retaining magnets / Raw magnets

Adhesive force / Influence factors

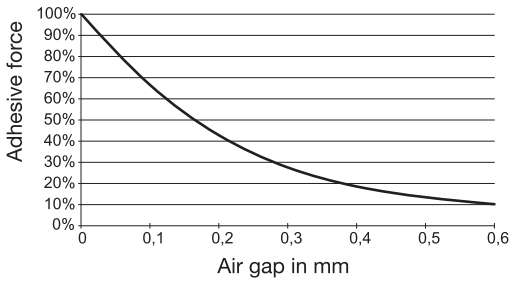
Adhesive force

In addition to their shape and material, the actual achievable adhesive force of the magnets depends on several other factors.

Influence factors

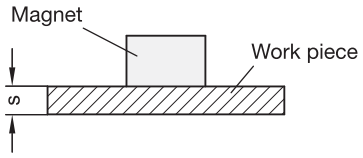
Air gap

An air gap or materials, which are not magnetically permeable between the work piece and the magnet, have an insulating effect on the magnetic flux. The adhesive force is reduced depending on the distance.



Work piece thickness

A minimum thickness of the work piece should be maintained in order to not restrict the magnetic flux and therefore the adhesive force.



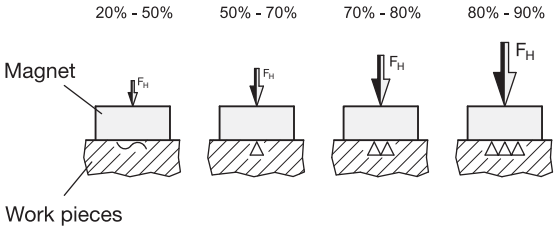
Material

Steel and ferrous materials with a low proportion of carbon and alloyed materials promote the magnetic flux. Similarly, non-hardened work pieces conduct the magnetic flux better, which enables greater adhesive forces.

100%	technical pure iron	86%	C60, X6Cr17
95%	St37, C15	84%	42CrMo4
94%	St44-2, 34CrNiMo6	75%	St50
93%	St52-3	72%	X155CrMo12
92%	90MnV8	65%	X210CrW12
90%	C45	50%	20MnCr5
87%	Ck45	30%	GG

Work piece surface

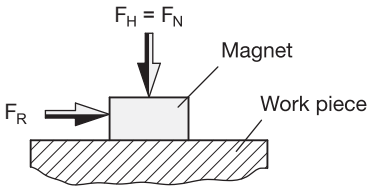
Excessive roughness or unevenness have the same effect as an air gap. They reduce the adhesive force.



Displacement force

The displacement force corresponds to the frictional force and depends on the coefficient of friction between the magnet and the work piece, as well as the adhesive force of the magnet.

Due to their higher coefficient of friction, rubberized magnet systems have greater displacement forces.



The nominal adhesive forces stated in the tables in the standards are minimum values, which are achieved at room temperature, vertical „pull-off“ and full contact of the magnets with low carbon steel work pieces and a minimum thickness of 10 mm.

Retaining magnets

disc-shaped, without thread

SPECIFICATION

Housing
Steel, zinc plated

Materials of the magnet:

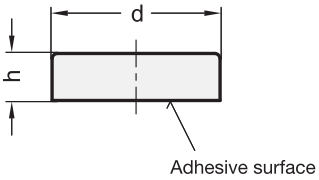
Hard ferrite **HF**
temperature resistant up to 200 °C

SmCo **SC**
Samarium, cobalt
temperature resistant up to 200 °C

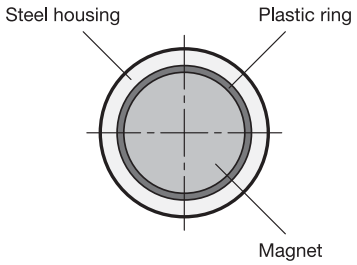
NdFeB **ND**
Neodymium, iron, boron
temperature resistant up to 80 °C

INFORMATION

Retaining magnets GN 50.1 are a shielded magnetic system.
Fixed in place by gluing or side-mounted thrust bolt (e.g. GN 913.2, see page 920) grub screw with pointed nose).
- More information to retaining magnets (see page 2022)



View on adhesive surface



GN 50.1

GN 50.2

Retaining magnets

disc-shaped, with female thread

SPECIFICATION

Housing / threaded bushing
Steel, zinc plated

Materials of the magnet:

Hard ferrite **HF**
temperature resistant up to 200 °C

SmCo **SC**
Samarium, cobalt
temperature resistant up to 200 °C

NdFeB **ND**
Neodymium, iron, boron
temperature resistant up to 80 °C

INFORMATION

Retaining magnets GN 50.2 are a shielded magnetic system.

GN 50.3

Retaining magnets
disc-shaped, with threaded stud

SPECIFICATION

Housing / threaded stud
Steel, zinc plated

Materials of the magnet:

Hard ferrite **HF**
temperature resistant up to 200 °C

NdFeB **ND**
Neodymium, iron, boron
temperature resistant up to 80 °C

INFORMATION

Retaining magnets GN 50.3 are a shielded magnetic system.
- More information to retaining magnets (see page 2022)

GN 50.25

Stainless Steel-Retaining magnets
disc-shaped, with female thread

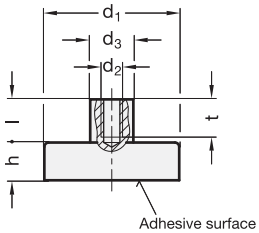
SPECIFICATION

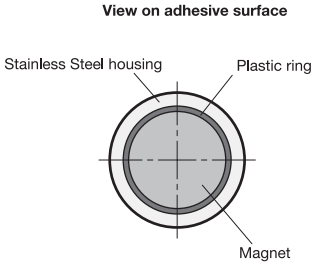
Housing / threaded bushing
Stainless Steel

Material of the magnet:
Hard ferrite **HF**
temperature resistant up to 220 °C

INFORMATION

Stainless Steel-Retaining magnets GN 50.25 are a shielded magnetic system.
Owing to the lower magnetic conductivity of the stainless steel housing, the adhesive forces are lower than in steel.
- More information to retaining magnets (see page 2022)





GN 50.25 **STAINLESS STEEL**

Description	d1	d2	d3	h	l	t	Nominal adhesive forces in N	⚖
GN 50.25-HF-25	25 ±0.1	M 5	8	7 +0.3/-0.1	9	8.25	32	20

GN 50.4

Retaining magnets

disc-shaped, with bore or female thread

SPECIFICATION

Housing
Steel, zinc plated

Materials of the magnet:

Hard ferrite **HF**
temperature resistant up to 200 °C

NdFeB **ND**
Neodymium, iron, boron
temperature resistant up to 80 °C

INFORMATION

Retaining magnets GN 50.4 are a shielded magnetic system.
To ensure that the magnetic properties (adhesive forces) are not impaired, the fixing screws must be made of **non-magnetic** material (magnetic not conductive).
- More information to retaining magnets (see page 2022)

GN 50.6

Retaining magnets

disc-shaped, with hook / with eyelet

SPECIFICATION

Types

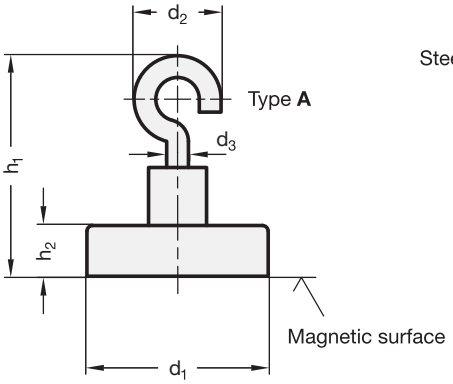
- Type **A**: with hook
- Type **B**: with eyelet

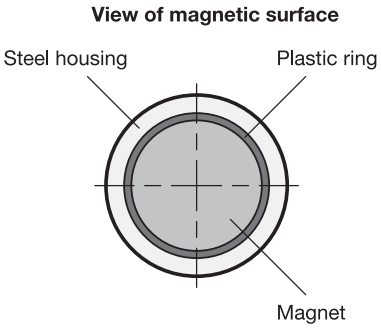
Housing / threaded bushing / hook / eyelet
steel, zinc plated

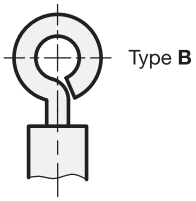
Material of the magnet:
Hard ferrite **HF**

INFORMATION

Retaining magnets GN 50.6 are a shielded magnetic system.
- More information to retaining magnets (see page 2022)







GN 50.6

GN 50.6-HF-80-B	80	20	6	51.5	18	600	496

GN 50.5

Retaining magnets

disc-shaped, with female thread

SPECIFICATION

Housing
Steel, zinc plated

Material of the magnet
NdFeB **ND**
Neodymium, iron, boron
temperature resistant up to 80 °C

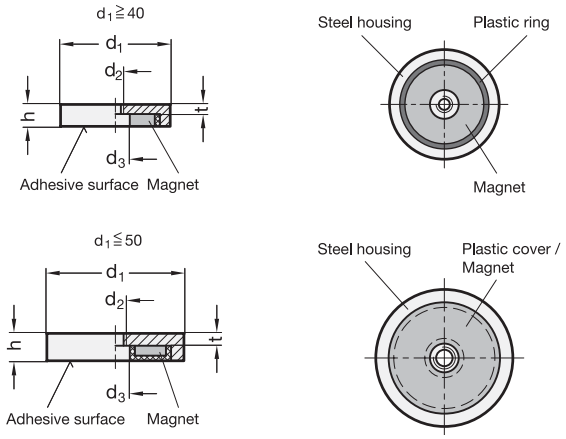
Plastic cover
Technopolymer (Polyamide PA)

INFORMATION

Retaining magnets GN 50.5 are a shielded magnetic system. For diameter $d_1 \geq 50$ the adhesive surface is lagged with a plastic cover. To ensure that the magnetic properties (adhesive forces) are not impaired, the fixing screws must be made of **non-magnetic** material.
- More information to retaining magnets (see page 2022)

TECHNICAL INFORMATION

- Plastic characteristics (see page A2)



GN 50.5

Description	d1 ±0.1	d2	d3	h ±0.2	t	Nominal adhesive forces in N	⚖
GN 50.5-ND-32	32	M 5	5.5	7	3	330	40

GN 50.5-ND-75	75	M 10	13	15	8.5	1750	479

GN 58

Pot magnets

with bore

SPECIFICATION

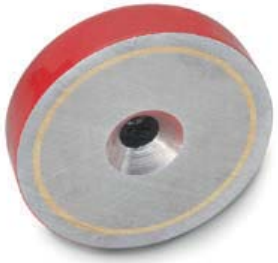
Housing
Steel

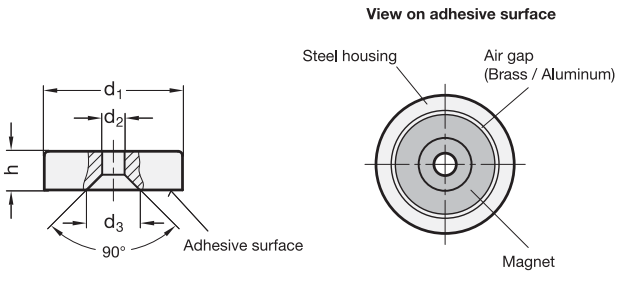
Material of the magnet
AlNiCo **AN**
Aluminium, nickel, cobalt
temperature resistant up to 280 °C

Lacquering red
temperature resistant up to 180 °C

INFORMATION

Pot magnets GN 58 are a shielded magnetic system.
To ensure that the magnetic properties (adhesive forces) are not impaired, the fixing screws must be made of **non-magnetic** material.
For easier handling and/or to avoid demagnetisation, these magnets have an iron plate on their adhesive surface.
- More information to retaining magnets (see page 2022)





GN 58

Description	d1	d2	d3	h	Nominal adhesive forces in N	⚖
GN 58-AN-19	19	3.7	8.7 +0.8/-0.2	7.5	30	17
GN 58-AN-29	29	4.8	10.5 +1/0	8.5 ±0.5	50	43
GN 58-AN-38	38	4.8	10 +1/-0.5	10.5	130	83

GN 51.5

Retaining magnets

disc-shaped, with female thread, with rubber jacket

SPECIFICATION

Steel part
zinc plated

Material of the magnet
NdFeB **ND**
Neodymium, iron, boron
temperature resistant up to 80 °C

Rubber jacket
Elastomer (TPE)
80 shore A ≈
black **SW**
white **WS**

INFORMATION

Retaining magnets GN 51.5 are a shielded magnetic system with rubber jacket.
The rubber jacket protects sensitive surfaces from being damaged by the magnet and also delivers a higher friction coefficient, resulting in high lateral adhesion forces.

- More information to retaining magnets (see page 2022)

TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)

GN 51.4

Retaining magnets

disc-shaped, with bore, with rubber jacket

SPECIFICATION

Steel part
zinc plated

Material of the magnet
NdFeB **ND**
Neodymium, iron, boron
temperature resistant up to 80 °C

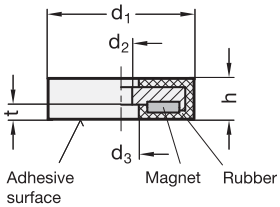
Rubber jacket
Elastomer (TPE)
80 shore A ≈
black **SW**
white **WS**

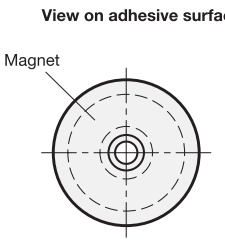
INFORMATION

Retaining magnets GN 51.4 are a shielded magnetic system with rubber jacket.
The rubber jacket protects sensitive surfaces from being damaged by the magnet and also delivers a higher friction coefficient, resulting in high lateral adhesion forces.
- More information to retaining magnets (see page 2022)

TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)





GN 51.4

GN 51.6

Retaining magnets

disc-shaped, with 2 female thread, with rubber jacket

SPECIFICATION

Steel part
zinc plated

Material of the magnet
NdFeB **ND**
Neodymium, iron, boron
temperature resistant up to 80 °C

Rubber jacket
Elastomer (TPE)
80 shore A ≈
black

INFORMATION

Retaining magnets GN 51.6 are a shielded magnetic system with rubber jacket.
The rubber jacket protects sensitive surfaces from being damaged by the magnet and also delivers a higher friction coefficient, resulting in high lateral adhesion forces.
Its dimensions, especially the drill hole spacing m and the thread d2, match the clamp mountings GN 473 (see page 1878), GN 477 (see page 1879) and GN 480 (see page 1885).
- More information to retaining magnets (see page 2022)

GN 54.1

Retaining magnets

rod-shaped, without bore

SPECIFICATION

Housing
Brass

Materials of the magnet:

SmCo **SC**
Samarium, cobalt
temperature resistant up to 200 °C

NdFeB **ND**
Neodymium, iron, boron
temperature resistant up to 80 °C

Identification of ND:
blue inked adhesive surface area

INFORMATION

Retaining magnets GN 54.1 are a shielded magnetic system.
The configuration of magnetic and iron poles is known as sandwich magnet system. These retaining magnets deliver ultimate holding power, also with smaller workpieces.
Attachment options include pressing in or gluing in.
* k_1 is the maximum dimension by which the retaining magnet can be shortened without losing its properties.
** Mounting these retaining magnets directly in steel components will create a magnetic shortcircuit which reduces the retaining power by as much as 15%. To avoid this effect, the spacings k_2 between brass jacket and steel component should be observed. These spacings should also be maintained if the retaining magnet is shortened.
- More information to retaining magnets (see page 2022)

Material of the magnet
NdFeB **ND**
Neodymium, iron, boron
temperature resistant up to 80 °C

INFORMATION

Magnets GN 53.1 are primarily used for holding drawings and the like.
The magnetic material ND is characterized by a high adhesive force.
- More information to magnets (see page 2022)

ON REQUEST

GN 51.7

Magnets

with ball knob / with key ring, with rubber jacket

SPECIFICATION

Types

- Type **A**: with knob
- Type **B**: with key ring

Steel part
nickel plated

Material of the magnet
NdFeB **ND**
Neodymium, iron, boron
temperature resistant up to 80 °C

Rubber jacket
Elastomer (TPE)
80 shore A ≈
black

Ball knob
Plastic
Technopolymer (Polyamide PA)
black, matt

Key ring
Steel, nickel plated

INFORMATION

Magnets GN 51.7 are a shielded magnetic system with rubber jacket. The rubber jacket protects sensitive surfaces from being damaged by the magnet and also delivers a higher friction coefficient, resulting in high lateral adhesion forces.

- More information to retaining magnets (see page 2022)

TECHNICAL INFORMATION

- Elastomer characteristics (see page A32)

Type **A**

GN 251.6

Setting bolts

with retaining magnet

SPECIFICATION

Screw Steel

- Tensile strength class 5.8
- zinc plated, blue passivated

Hexagon nut Steel

- Tensile strength class 04
- zinc plated, blue passivated

Material of the magnet
NdFeB **ND**
Neodymium, iron boron
temperature resistant up to 80 °C

INFORMATION

Setting bolts GN 251.6 with retaining magnet are a shielded magnetic system.
Suitable e.g. as workpiece stop, with the magnet holding the workpiece in place.
The locking nut (included) can be used to secure the stop screw after positioning.

- More information to retaining magnets (see page 2022)

TECHNICAL INFORMATION

- Strength values of screws (see page A20)

Raw magnets

disc-shaped, with bore or countersunk

SPECIFICATION

Materials of the magnet:

SmCo **SC**
Samarium, Cobalt
blank
temperature resistant up to 200 °C

NdFeB **ND**
Neodymium, iron, boron
temperature resistant up to 80 °C

INFORMATION

Raw magnets GN 55.1 are unshielded disc-shaped (annular) magnets.
Owing to their vast range of different magnet materials and sizes, they are suitable for virtually universal use. They are mostly attached by gluing.
When used without air gap, individual raw magnets always have lower adhesive forces than a magnet system in which shielding and magnetic return enormously intensify the force acting at the adhesion surface. Depending on the air gap between magnet and mating component, individual raw magnets - unlike magnet systems - can have substantially higher adhesive forces.
In the event that no suitable retaining magnets / magnet systems are available, raw magnets may be used in combination with appropriate holding constructions to build up highly specific magnet systems.
- More information to retaining magnets (see page 2022)

ON REQUEST

- made of hard ferrite (HF)

Retaining magnets

for profile systems

SPECIFICATION

Plastic
Technopolymer (Polyamide PA)
black, matt **SW**

Material of the magnet
NdFeB
Neodymium, iron, boron
temperature resistant up to 80 °C

Steel insert, grub screw
zinc plated, blue passivated

INFORMATION

With GN 56 retaining magnets doors, covers or even tools and accessories can simply be attached to profile systems using magnets.
Thanks to the side-mounted plastic spring elements the retaining magnet can be introduced into a profile nut at any point. When affixed this way, the magnet holds with a multiple of its magnet nominal holding force in the nut. If necessary, the retaining magnet can be taken out of the nut again with a suitable screw driver via the recesses on the front.
Lightly turning the threaded pin against the groove base stops the retaining magnet from moving in the direction of the nut. Additional protection against sideward movement can be achieved with nuts for T-nuts GN 506 (see page 982), for example.

Adhesive discs

self-adhesive, for retaining magnets

SPECIFICATION

Steel
- zinc plated, blue passivated **ZB**
- zinc plated, blue passivated, white laquered **WS**

Adhesive pad
Scotch-Mount ™ 4032
- doubled-sided
- with polyurethane foam backing

INFORMATION

Adhesive discs GN 70.1 are used as counter piece for retaining magnets if a magnet is to be used on a non-magnetic surface, for instance.
After pulling off the protective film from the adhesive pad at the back, they can be attached to any suitable and clean surfaces.

TECHNICAL DATA INDEX

TECHNICAL DATA

The technical data presented here refer mainly to the ELESA+GANTER Standard elements, made of engineering plastics and metal material.
The main technologies used for the manufacture of plastic products are:
– compression/transfer moulding for Duroplasts;
– injection moulding for Technopolymers.
This primary process may be followed by secondary operations such as machining, finishing, assembly, decoration to customize the product (tampoprinting), packaging to guardantee adequate protection during transportation and identification of the product.

1. Plastic materials

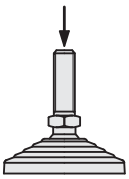
DUROPLASTS: phenolic based (PF) thermosetting plastics that harden during moulding due to irreversible polymerization.
TECHNOPOLYMERS: thermoplastic polymer materials for technical use in which the chemical composition of the molecular chain provides a wide range of mechanical, thermal, and technological properties. The transformation process is based on the melting and subsequent hardening by solidification of the material in the mould. The material itself has a low environmental impact because it can be recycled (reversible solidification).

The main technopolymers used by ELESA+GANTER						
PA Glass-fibre reinforced polyamide, with glass filler or glass micro-spheres or polyamidebased SUPER technopolymers	**PA-T** Special transparent polyamide	**PP** Glass-fibre reinforced polypropylene or with mineral fillers	**POM** Acetal resin	**PC** Special polycarbonate	**PBT** Special polyester	**TPE** Thermo-plastic elastomer

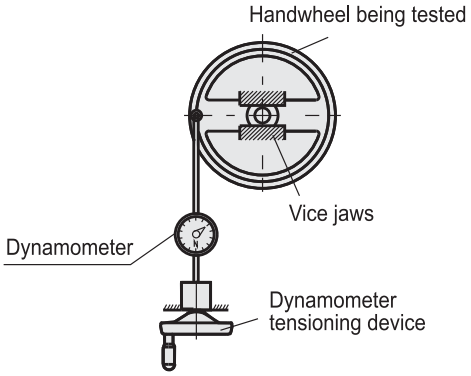
1.1 Mechanical strength

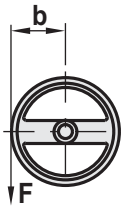
DUROPLASTS: the addition of mineral fillers, natural textile fibres and the optimum selection of the basic resin give this material an excellent mechanical strength, a high superficial hardness and a good impact strength.
TECHNOPOLYMERS: the rich selection of basic polymers available and the possibility of combining these with reinforcing fillers or additives of various kinds make a wide range of performance levels possible in terms of mechanical strength, impact strength, creep and fatigue.
The mechanical properties of a moulded plastic component may vary significantly according to its shape and the technological level of the manufacturing process. For this reason, instead of providing tables containing specific data on the mechanical strength of test pieces of various types of material, ELESA+GANTER has decided to inform designers of the forces which, in the most significant cases, may cause the component breakage. For most products, the mechanical strength values indicated in the catalogue are therefore loads at breakage.
The deformation under a load is not negligible for some products and may therefore jeopardise their performance, even before their breakage. Thus for these products, two load values are provided:
– **maximum working load** below which deformation DOES NOT jeopardise the component performance;
– **load at breakage** in accordance with the concepts outlined above.
In these cases, the "maximum working load" will be used as maximum design data to guarantee the correct performance, while the "load at breakage" will be used for safety tests.
Obviously, in both cases suitable safety coefficients must be applied.
Working stress has been taken into account (e.g. the transmission of torque in the case of a handwheel, the tensile strength in the case of a handle) as well as accidental stress (e.g. an impact with the component), in order to provide designers with a reference for determining suitable safety coefficients, according to the type and importance of the application.
All the strength values supplied were obtained from tests carried out in ELESA+GANTER Laboratories, under controlled temperature and humidity (23 °C – Relative Humidity of 50 %), under specific working conditions, and by applying a static load for a necessarily limited period of time.
The designer must therefore take into account adequate safety coefficients according to the application and specific operating conditions (vibrations, dynamic loads, working temperatures at the limits of the allowed temperature range). In the end, however, the designer is responsible for checking that the product is suitable for its intended purpose.
For some thermoplastics, for which the mechanical properties vary significantly in relation to the percentage of moisture absorbed (see chapter 1.5), the resistance tests on the component are carried out in compliance with ASTM D570, so that the moisture absorbed is in equilibrium with respect to ambient conditions of 23 °C and a RH of 50 %.

• **Compressive strength for levelling elements** (working stress)
The levelling element is assembled on its threaded metal stud and placed on special testing equipment. The element is then subjected to compressive stress with repeated and incremental loads until it breaks or undergoes a permanent plastic deformation of the plastic element.



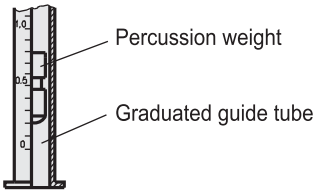
• **Resistance to transmission of torque** (working stress)
Use is made of an electronic dynamometer that applies increasing torque values as shown in the chart hereunder. The dynamometric system in the torque is shown in a traditional way to make the comprehension easier. The mean values of the torque C, obtained in the breaking tests, are shown in the tables for the various components and expressed in [Nm].

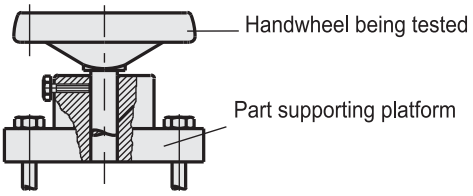




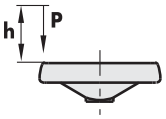
C [Nm] = F [N] • b [m]

• **Impact strength** (accidental stress)
The special equipment is used as shown in the chart.

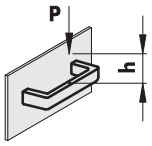




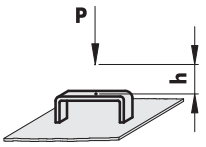
The mean values obtained in the breaking test, shown in the tables for the various models and expressed in [J], correspond to the breaking work L of the element subjected to repeated impacts, with the falling height (h) of the percussion weight (P) being increased by 0.1 m each time. Percussion weight (P): metal cylinder with a rounded ogival shaped end and weighing 0.680 kg (6.7N).



L [J] = P [N] • h [m]

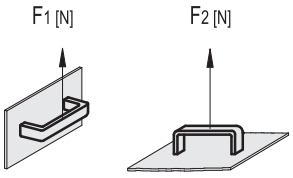


L_1 [J] = P [N] • h [m]



L_2 [J] = P [N] • h [m]

• **Tensile strength of U-shaped handles** (working stress)
This test entails fitting the handle to be tested on an electronic dynamometer, with two types of stress:
– perpendicular to the mounting screws (F1): here the stress on the handle is a mixed combination;
– parallel to the mounting screws (F2).
The load applied by the electronic dynamometer increases gradually in order to obtain a deformation of the tested element within a limit of 20 mm/min.



1.2 Thermal resistance

The use of thermosetting materials and reinforced thermoplastic polymers with a high Thermal resistance enables ELESA+GANTER to obtain products with great thermal stability and a limited variation in their mechanical properties at both high and low temperatures. The recommended operating temperature range for each plastic product in this catalogue is indicated by the symbol, which is shown here on the left. Within this temperature range:
– the material is stable and no significant degradation takes place:
– the user does not normally encounter any problem with the basic performance of the product.

The mechanical strength, impact strength, maximum torque and maximum working pressure values indicated in the catalogue were obtained from tests carried out under laboratory conditions (23 °C – Relative Humidity of 50 %). These values may vary over the working temperature range indicated. Customers are therefore responsible for checking the product's actual performance in their specific thermal working conditions. A very general indication, as to the working temperature range for the various types of plastics, is given in the table below.

Material	Working temperature range
Duroplasts (PF)	from -20 °C to 100°/ 110 °C
Special, high-resistence polypropylene based (PP) technopolymers	from 0 °C to 80°/ 90 °C
Glass-fibre reinforced polypropylene based (PP) technopolymers	from 0 °C to 100 °C
Polyamide based (PA) technopolymers	from -20 °C to 90 °C
Glass-fibre reinforced polyamide based (PA) technopolymers	from -30 °C to 130°/ 150 °C
Glass-fibre reinforced polyamide based (PA) technopolymers for high temperatures	from -30 °C to 200 °C

1.3 Strength and surface hardness

DUROPLASTS: the high surface hardness of the material and its glossy finish, obtained by the mould, enable the surfaces to be kept in perfect condition, even after prolonged use in the presence of metal machining residues or in abrasive environments, as for example, in metal machining applications with machine tools.
TECHNOPOLYMERS: the surface hardness values are lower than those of Duroplast, but are still within the 60 – 98 Rockwell range, M scale. Technopolymers are however tougher and have a greater impact strength than Duroplasts.

1.4 Resistance to chemical agents

The tables in Chapter 10 (see page A15) describe the resistance of the plastic materials used for ELESA+GANTER products, at an ambient temperature of 23 °C, in the presence of the various chemical agents they may come into contact with, in an industrial environment (acids, bases, solvents, lubricants, fuels, and aqueous solutions) and indicate 3 classes of resistance:
– good resistance = the product functional and aesthetic properties remain unchanged;
– fair resistance = effects on the functional and/or aesthetic properties, depending on the type of product and the working conditions with some limitations of use according to the specific application;
– poor resistance = product susceptible to chemical aggression. Not recommended for use.
As a general rule, chemical resistance decreases as the working temperature and mechanical stresses, to which the product is subjected, increase. The presence of high temperatures and high levels of mechanical stress together require to the product resistance to chemical agents be tested.

1.5 Resistance to atmospheric agents and UV rays

In most cases, ELESA+GANTER plastic Standards are used for "indoor" applications. In any case, due to the properties of the materials and the measures taken during the design stage, these products may also be used for "outdoor applications", where they are exposed to particular atmospheric conditions:
• **rapid changes in temperature:** within the working temperature range recommended for each product, rapid changes in temperature do not create problems due to the impact strength of the materials used;
• **the presence of water or moisture:** may result in processes of hydrolysis and the absorption of a certain percentage of the water/moisture until a state of equilibrium is reached. This may alter some of the material's mechanical properties.
Examples of materials that absorb water include polyamides (PA), transparent polyamides (PA-T, and PA-T AR) and duroplasts (PF).
Products made of these materials may undergo slight changes in size due to the absorption of water, which may affect dimensional tolerances. During the design stage, ELESA+GANTER normally takes these possible variations into account in order to minimise their effects and to guarantee compliance with the technical specifications.
The absorption of water results in a significant increase in impact strength. The following polymers do not absorb water: polypropylene (PP), thermoplastic elastomers (TPE), and acetal resin (POM). Occasional contact with rainwater followed by "drying" does not generally pose any problems in terms of the strength of the product. When used in "outdoor" applications, it is advisable to prevent water accumulating on the product by adopting suitable assembly conditions.
• **Exposure to the sunlight and UV rays** in particular.
Specific resistance tests have been carried out using specific equipment for accelerated ageing testing, in accordance with the ISO 4892-2 standard, and setting the following parameters:
– radiation power: 550 [W]/[m]2;
– internal temperature (Black Standard Temperature, BST): 65°C;
– OUTDOOR filter that simulates exposure to the open air, with low shielding against UV rays;
– relative humidity: 50 % U.R.

The relation between the hours of testing and the hours of actual exposure to an outdoor environment ("Equivalent Hours") obviously depends on the weather conditions of each geographic area. Taking the Average Radiant Exposure per Day (ARED) as a basis for comparison, the reference values adopted on an international scale include:
– Miami Equivalent Hours = high intensity exposure, typical of countries with a tropical or equatorial climate (ARED = 9.2 MJ/m^2);
– Central Europe Equivalent Hours = mean intensity of exposure, typical of continental climates (ERMG = 2 MJ/m^2).
At the end of prolonged tests carried out at the ELESA+GANTER laboratories, the variation in mechanical strength was measured (tensile/compression breaking, and impact breaking) was measured. In general, the results show that the mechanical strength of polyamide (PA), polypropylene (PP) and Duroplast (PF) products is not significantly reduced by exposure to UV rays.
As to the aesthetic appearance of samples exposed to the action of the UV rays, in some cases a slight variation in the surface appearance of the product was found, on completion of the tests.
For further details on UV ageing tests on specific products, contact the ELESA+GANTER Technical Department.

1.6 Flame resistance

The universally recognised classification used to describe the reaction of plastics to flames is obtained from two tests defined by UL (Underwriters Laboratories, USA). These tests are called: UL-94 HB and UL-94 V.
They define four main types of reaction to flames: HB, V2, V1 and V0 with progressively increasing levels of flame resistance.

• UL-94 HB (Horizontal Burning)

The test consists of putting a set of three standardized samples of the plastic (in a horizontal position set at an angle of 45° with respect to their own axis) each one in contact for 30 seconds with a flame applied at their bottom free edge.
Two marks are present on the samples at standardized distances from the free end.
A material may be classified HB if, for each of the three samples, the following conditions are applicable:
– the speed of burning between the two marks does not exceed a given standardized value that depends on the thickness of the samples being tested;
– the flame is extinguished before the fire reaches the furthest mark from the free edge (that is, from the point of application of the flame).

• UL-94 VB (Vertical Burning)

The test entails putting a set of five standardised samples of the plastic (in a vertical position) into contact each one twice for 10 seconds with a flame applied at their bottom free edge. A sheet of cotton wool is placed underneath the samples.
The following parameters are measured:
– the time required to extinguish each individual sample each time the flame is applied;
– the sum of times required to extinguish the five samples (considering both flame applications specified);
– the post-incandescence time of each individual sample after the second flame application;
– whether any material drips from the sample onto the cotton wool set underneath it with a risk of igniting it.

UL Classification of plastic materials				
UL-94 HB	For each of the three samples, the speed of combustion between the two marks does not exceed the standardized speed that depends on the thickness of the samples. For each of the three samples, the flame is extinguished before it reached the further mark from the point of application of the flame.			
UL-94 V		V2	V1	V0
	Time required to extinghuish each individual sample after each flame application.	≤ 30 s	≤ 30 s	≤ 10 s
	Sum of times required to extinghuish the five samples (considering both flame applications specified).	≤ 250 s	≤ 250 s	≤ 50 s
	Post-incandescence time of each individual sample after the second flame application.	≤ 60 s	≤ 60 s	≤ 30 s
	Presence of any material dripping from the sample onto the cotton wool beneath it with the risk of igniting it.	YES	NO	NO

The variables that determine the reaction to the flame include the thickness of the samples and the colouring of the material, in fact, there may be differences between materials with their natural colour and those with an artificial colour and differences depending on the variation in thickness of the sample with the same colour.

Yellow Card: this is a document issued by the Underwriters Laboratories that certifies the reaction of a plastic to flames, following laboratory testing. This constitutes an official recognition of the product's flame resistance.
The "Yellow Card" indicates the trade name of the product, the manufacturer and related ID number, known as a UL File Number. The flame resistance is certified for specific material thickness and colour. Some material manufacturers carry out flame resistance tests in independent laboratories, using the same test methods as the Underwriters Laboratories.
In such cases, a declaration of conformity but no "Yellow Card" is issued by the manufacturer.
Most of the other ELESA+GANTER products for which no specific indication is given in this regard belong to the UL94-HB category.
There are groups of ELESA+GANTER Standards with UL-94 V0 classification, identified as AE-V0 by the symbol shown in the title.
ELESA+GANTER products identified as AE-V0 are made of environment-friendly plastics and are free of PBB (Polybromine Biphenyl), PBDE (Polybrominediphenyl Ether) and in particular of Penta-BDE (Pentabromodiphenyl Ether) and of Octa-BDE (Octabromodiphenyl Ether).

1.7 Electrical properties

Plastics are generally good electrical insulators. This is particularly useful in certain applications in the electromechanical field, making plastic products preferable to similar metal products.
The extent of a material insulating properties is determined by:
- **its surface resistivity**
- **its volume resistivity.**

The table below classifies the materials on the basis of their surface resistivity [Ω]:

Conductive material	Semi-conductive material	Dissipative material	Anti-static material	Insulating material
10^{-1} Ω	10^{5} Ω	10^{9} Ω	10^{12} Ω	> 10^{12} Ω

Due to an increase in the performance of the electronic products and the diffusion of their use in different applications, there has been a rise in the market demand for thermoplastic products which may satisfy the requirements of standard conductivity for the ESD (Electro Static Discharge) applications.
The ESD product line developed by ELESA+GANTER uses materials with a reduced surface resistivity (conductive), marked with the symbol of ESD-C protection indicated in the title.
Typical values, for a few of the plastics used by ELESA+GANTER, are:

Material	Property	Measuring Method	State of material	Value
PA 30 % glassfibre	Surface Resistivity	IEC93, 23 °C	Dry	10^{13} Ω
			Conditioned (50 % RH equil.)	10^{11} Ω
	Volume Resistivity		Dry	10^{15} Ω •cm
			Conditioned (50 % RH equil.)	10^{11} Ω •cm
PP 20 % mineral filler	Surface Resistivity	ASTM D257	Conditioned (50 % RH equil.)	10^{13} Ω
PA ESD	Surface Resistivity		Dry	10^{3} Ω
			Conditioned (50 % RH equil.)	10^{3} Ω
	Volume Resistivity		Dry	10^{3} Ω •cm
			Conditioned (50 % RH equil.)	10^{3} Ω •cm

1.8 Surface finish and cleanability

In moulding technopolymers, it is technically easier to make products with a rough matte surface finish, which hides any aesthetic defect such as shrinkage cavities, flow marks, or joining marks caused by non-optimum moulding processes.
However, a rough matte finish makes it more difficult to clean the component, especially if made out in light colours, and its handling for a long use.
ELESA+GANTER technopolymer Standards have a very fine matte finish so that the product remains easy to clean in time, and it is easier for the user to handle it.
Some groups of technopolymer products have recently been developed with a completely glossy finish, so that they remain clean for a long time.

1.9 Compliance with international standards

Over the past few years, the national and international regulatory authorities have laid down a series of regulations for the control of substances that are harmful to man or the environment and for the environment safety management in the industrial field.

- **European Directive 2002/95/CE RoHS (Restriction of Hazardous Substances)** applicable to the field of electrical and electronic equipment. This provides for a gradual reduction in the heavy metals (Pb, Cd, Hg, and Cr6) and halogens (PBB and PBDE) present in the components used in the electrical and electronic industries.
  In the data sheet of each product the "RoHS compliance" is indicated by the green symbol. The presence of this symbol means that all the technical problems related to the materials used for the chosen product have been solved out in compliance with the European irective 2002/95/CE. In practice, it could happen that the stock rotation process has not been completed yet: anyway, on ELESA+GANTER website www.elesa-ganter.com it is possible to make a check.
  ELESA+GANTER Technical Department is always at the customer's disposal for any kind of assistance.
- **European Regulation n.1907/2006 - REACH (Registration, Evaluation, Authorisation and restriction of Chemicals)**, applicable to all the chemical substances circulating in the European Community, aiming at improving the knowledge of the dangers and risks arising from the existing chemical substances and from the new ones.
- **European Directive 2000/53/CE - ELV (End Life of Vehicles)**, applicable to the automotive field. This provides for a gradual reduction in the heavy metals Pb, Cd, Hg, and Cr6, resent in vehicles.
- **RAEE (WEEE) Directive**, Waste of Electrical and Electronic Equipment.
- **ATEX Directive 94/9/CE - ATEX**, effective since the 1st of July 2003, refers to work environments with explosion risks and classifies the zones where a potentially explosive atmosphere may occur. ATEX marking (together with the declaration of conformity) certifies that the item, on which it is applied, was manufactured in compliance with all the requirements and provisions of the European Union Directive 94/9/EC (mandatory since 1st of July 2003) and that it was submitted to the procedures for conformity assessment. In accordance with this directive, certification is compulsory for all the equipment and protection systems, for the components (which are necessary for operating in safe conditions) that will be used in potentially explosive atmospheres (either pneumatic, hydraulic, electrical, mechanical) and for all safety, control and adjustment devices needed for the safe operation of the equipment and the protection systems, installed out of the potentially explosive atmosphere, but having the function of protection against explosion risks.

Hazardous zones (are classified according to the frequency and duration of the occurrence of a potentially explosive atmosphere):

- **zone 0** area in which a potentially explosive atmosphere, consisting of a mixture of air and flammable substances in the form of gas, vapour or mist, is present always, for long periods or often (at least 1000 hours/year);
- **zone 1** area in which, during normal operations*, a potentially explosive atmosphere, consisting of a mixture of air and flammable substances in the form of gas, vapour or mist, is occasionally present or with a small frequency (more than 10 hours and less than 1000 hours/year);
- **zone 2** area in which, during normal operations*, a potentially explosive atmosphere, consisting of a mixture of air and flammable substances in the form of gas, vapour or mist, is present only for a short time or seldom (less than 10 hours/year);
- **zone 20** area in which a potentially explosive atmosphere in the form of a cloud of combustible dust in air is present always, often or for long periods (at least 1000 hours per year);
- **zone 21** area in which, during normal operations*, a potentially explosive atmosphere, in the form of a cloud of combustible dust in air is occasionally present or with a small frequency (more than 10 hours and less than 1000 hours/year);
- **zone 22** area in which, during normal operations*, a potentially explosive atmosphere, in the form of a cloud of combustible dust in air is present only for a short time or seldom (less than 10 hours/year).

* normal operations means the situation in which installations are used within their design parameters.

The directive identifies two groups of equipment (I and II), in accordance with the environment in which it is used:

- **group I** comprises equipment intended for use in the underground parts of mines, and/or in the surface parts of such mines;
- **group II** comprises equipment intended for use in environments other than those specified for group I.

Within group II, the devices subject to the provisions of ATEX directive are subdivided into categories according to the combination of explosion hazard zones and equipment groups:

- **category 1** comprises equipment and protection systems in this category are intended for use in areas in which explosive atmospheres are present for long periods or often (1000 hours or more/year), ensuring a very high level of protection;
- **category 2** comprises equipment and protection systems in this category are intended for use in areas in which, during normal operations, explosive atmospheres are present, with a small frequency or occasionally (10 – 1000 hours/year), ensuring a high level of protection;

- **category 3** comprises equipment and protection systems in this category are intended for use in areas in which, during normal operations, explosive atmospheres are present only for a short period or seldom (less than 10 hours/year), ensuring a normal level of protection.

ZONE	0 G (gas)	20 D (dust)	1 G (gas)	21 D (dust)	2 G (gas)	22 D (dust)
Explosive atmosphere	High probability, continuously or frequently		Average probability, sometimes, occasionally		Low probability, seldom, almost never	
CATEGORY in accordance to ATEX 94/9/EC Directive	**1**		**2**		**3**	

The directive also specifies the Groups of substances, classifying the substances that create potentially explosive atmospheres with air based on their hazardousness.
The hazardousness depends on the gas ignition temperature.
The table below shows some examples of gases with their related classification.

Gas	Group
Propane	IIA
Ethylene	IIB
Acetylene	IIC

Equipment with IIB marking are suitable also for applications that require equipment of explosion group IIA, those marked with IIC are suitable also for applications that require equipment of explosion groups IIA and IIB.
The table below shows the temperature classes, that indicate the max surface temperature (detected on the surface of the piece into contact with air), that must not be exceeded, to prevent ignition.

Max surface temperature	Temperature class
450 °C	T1
300 °C	T2
200 °C	T3
135 °C	T4
100 °C	T5
85 °C	T6

ELESA+GANTER products are components necessary for the safe operating of equipment and protection systems included in Group II (environments other than mines).
The following table shows the related categories:

Zone	2 (20)	1 (21)	2 (22)
Group II environments other than mines	**Category 1** presence of explosive atmosphere > 1000 h/year	**Category 2** presence of explosive atmosphere > 10 and < 1000 h/year	**Category 3** presence of explosive atmosphere > 10 and < 10 h/year

The following example shows the ATEX classification of an ELESA+GANTER product, (a breather cap of the SFP series): CE II 2GD IIB T6 where:

CE – marking CE
Ex – protection against explosion symbol
II – indicates the equipment group
2 – indicates the category it belongs to (and therefore the protection level ensured)
G e D – indicate the type of potentially explosive atmosphere where the component can operate (G = gas, D = dust). They can be present alternatively or simultaneously (like in this case)
IIB – indicates the substance group type (gas, vapours or mists)
T6 – indicates the temperature class

'k' protection factor: most of ELESA+GANTER products included in the line of accessories for hydraulic systems are also certified according to EN 13463-8 standard (Protection by liquid immersion 'k'): the equipment protection is based on the presence of a liquid that prevents the formation of sparks and other causes of ignition.
The following example shows the ATEX classification of a certified ELESA+GANTER product, e.g. a plug of the TN series, according to EN 13463-8 standard, in which "k" is evidently present: CE Ex II 2GD k T5.

Code	Description	Classification ATEX	See page
58296-EX	TN-3/8-EX	CE ex II 2GD kT5 1146	1665
58297-EX	TN-1/2-EX	CE ex II 2GD kT5 1146	1665

–	GN 743.6-11-G3/8	CE ex II 2GD TX 1194	1732
–	GN 743.6-14-G1/2	CE ex II 2GD TX 1194	1732
–	GN 743.6-18-G3/4	CE ex II 2GD TX 1194	1732

In an industrial environment, i.e. where ATEX Group II products are used, it is the user's responsibility to classify the zones in relation to the "potential" presence of gases, vapours and explosive dusts, identifying the relevant work places and working activities where explosion risks are present or could trigger, according to his/her risks assessment.
The manufacturer provides all the necessary information related to the Groups and Categories of the product, in order to allow the user to decide in which zone the ATEX product can safely operate, even if he/she is not able to foresee where and how it will actually operate.

1.10 Competence of ELESA+GANTER Technical Department

Ongoing research and experimentation with new materials that offer increasingly high levels of performance are parts of the principles of continuous improvement on which ELESA+GANTER Quality System is based. Our partnership with the leading plastics manufacturers in the world and the use of mechanical and process simulation programs allow us to offer the material that best suits the Client's specific application.

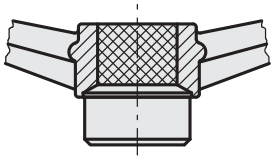
2. Metal materials

Most of ELESA+GANTER plastic elements contain inserts or functional components made of metal. The tables (Stainless steel – Carbon steels, Zinc alloys, Aluminium and Brass – Duroplasts) describe the chemical composition and mechanical strength values as per the reference standards for the metals used.
Surface treatments for metal inserts and parts: the surface of metal inserts or functional parts is generally treated to ensure the maximum protection against environmental agents, in order to maintain the product's aesthetic and functional qualities.
The protective treatments normally used include:
– burnishing of steel bosses and hubs;
– zinc-plating of threaded studs (Fe/Zn 8 in compliance with the UNI ISO 2081 standard);
– matte chromium plating of lever arms and revolving handles shanks.
Metal parts made of brass or stainless steel do not normally require surface treatment.
On request and for sufficient quantities, inserts subjected to other types of protective surface treatment may be supplied: black zinc-plating, nickel-plating, Niploy-Kanigen process, chromium plating, anodising and other, heat treatments like nitriding, hardening and case-hardening.

TECHNICAL DATA

2.1 Properties of metal inserts

The diamond knurling, of a shape, pitch and depth suited to the stress to be applied, is normally adopted, aiming at ensuring the most effective anchoring of the metal inserts to the plastic material and the best mechanical operation of the element. This type of knurling ensures both axial anchoring (that contrasts axial tensile stress) and radial anchoring (to avoid rotation during the transmission of torque).



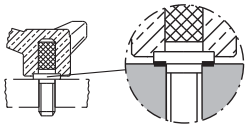
For threaded studs, instead of using a common screw available on the market, they use specially shaped threaded insert which protrudes a few tenths of mm from the plastic body so as to form a metal face on the screwing plane, thus freeing the plastic material of all stresses.

2.2 Clamping knobs with threaded inserts (Types of assembly)

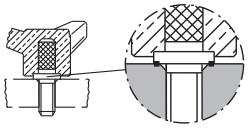
Types of assembly that create optimum clamping conditions

The plastic base on the clamping knob should never rest on the clamping surface. In this way the metal inserts (threaded stud or tapped boss) are never subjected to abnormal twisting ("corkscrew" effect) when axial tensile stress is applied. Thus, the anchoring of the metal insert to the plastic material is stressed in the correct way, that's to say it is only subject to the torque applied to the knob for tightening it.

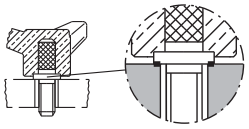
1. Threaded hole, without any chamfer or countersinking.



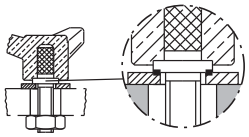
2. Threaded hole with chamfered edge or countersinking of a smaller diameter than that of the face on the stud, in order to ensure an adequate overlap between the metal insert and the clamping surface.



3. Plain cylindrical hole of a smaller diameter than that of the face on the stud, in order to ensure an adequate overlap between the metal insert and the clamping surface.



4. Plain cylindrical hole of a larger diameter than that of the face on the stud, setting in between a steel washer whose hole has a smaller diameter than that of the face of the stud. This guarantees an adequate overlap between the metal insert and the clamping surface, thanks to the washer.

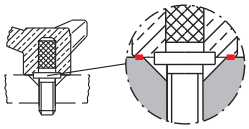


Incorrect types of assembly

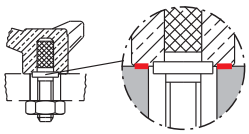
When the plastic base of the clamping knob rests directly on the clamping surface, the threaded stud or tapped boss are also subject to an axial load ("corkscrew" effect), which could jeopardize its anchoring to the plastic material.

The values of this force are always higher, with a broad safety margin, than those that may be applied by normal operations performed by hand, but designers who wish to take into account cases of improper use should avoid the situations illustrated in cases 5-6-7.

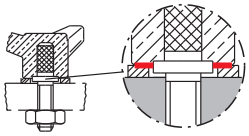
5. Threaded hole and champfer or countersinking with a larger diameter than that of the face on the stud.



6. Cylindrical through hole with a larger diameter than that of the face on the stud.



7. Threaded hole without any chamfer or countersinking, setting in between a steel washer whose hole has a diameter larger than that of the face on the stud.

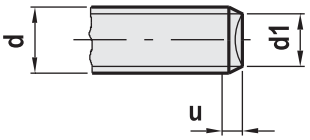


2.3 Pass-through holes

For knobs in which pass-through holes (FP type) have to be made, the insert is set in such a way that the machining of the hole or the broaching of a keyway only affects the metal part, without the plastic material having to be machined in any way.

2.4 End of threaded studs

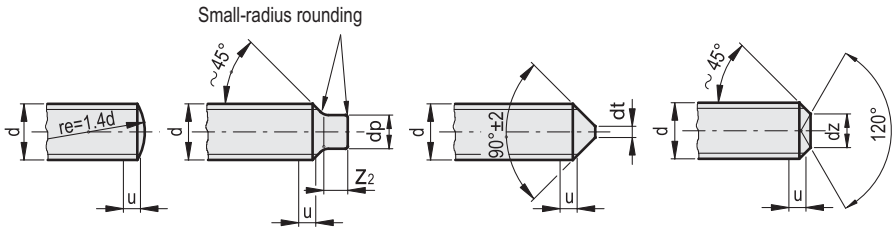
All threaded studs of the ELESA+GANTER elements have a chamfered flat end in compliance with ISO 4753.



Chamfered (rolled) end

d1 = Ø thread minor diam.
P = pitch
u = 2P incomplete threads

On request and for sufficient quantity, studs with different kinds of ends may be provided. These ends may be of the types shown hereunder, as indicated in the ISO 4753 table for "Fixing elements: ends of elements with ISO metric outside threading".



Convex end | Long cylindrical end | Truncated conic end | Cup end

P = pitch
u = 2P incompleted threads

2.5 Seizure risk with stainless steel threaded couplings

The stainless steels generally used for fasteners are:
– A2 (similar to AISI.304 steel)
– A4 (similar to AISI.316 steel)
An indelible marking always identifies the steel type and the mechanical strength class.
The tightening torque is dependent upon:
– The nominal diameter of the threading
– The mechanical strength class of stainless steel (50-70-90)
– The friction coefficient.
A high friction leads to the dissipation of a large amount of energy. The stainless steel thermal conductivity is about half that of carbon steels, therefore the tightening of the screw and nut, both made out of stainless steel, increases the heat generated towards the plastic deformation of the material thus creating a potential locking condition (seizure) of the coupling. In the case of disassembly and reassembly of the coupling, the seizure risk increases considerably. In practice, to avoid this risk, it is recommended to lightly lubricate both the threading and the nut under head with MoS2 paste or simply use some anti-corrosive grease.

3. Other materials

GASKETS
ELESA+GANTER normally uses gaskets made of synthetic nitrile butadiene rubber (NBR) or acrylonitrile butadiene rubber (BUNA N) for its products, with hardness values ranging from 70 to 90 SHORE A depending on the type of product considered.
The working temperature range for continuous use is -30 °C to +120 °C. Where a higher chemical and thermal resistance is required, that is, for products in the HCX-SST, HCX-SST-BW and HGFT-HT-PR series, gaskets made of FKM fluorinated rubber are used.
For chemical resistance values, see the table in chapter 10 (on pages A30, A31 and A32).
The working temperature range is from -25 °C to +210 °C.
On request and for sufficient quantity, flat washers and O-rings made of special materials such as EPDM, silicone rubber, or others may be supplied.

AIR FILTERS for filler breather caps (SFC., SFN., SFP., SFV., SFW., SMN. and SMW. series):
– TECH-FOAM type filters polyester-based polyurethane foam mesh, degree of filtration 40 microns, recommended for temperatures of between -40 °C and +100 °C for continuous use, and brief peak temperatures of +130 °C. This material does not swell in contact with water, petrol, soap, detergents, mineral oils or grease. Some solvents may cause slight swelling of the foam (benzene, ethanol, and chloroform);
– TECH-FIL type filters made of zinc-plated iron wire (quality as per DIN 17140-D9-W.N.R 10312, zinc-plated as per DIN 1548), degree of filtration 50 – 60 microns.

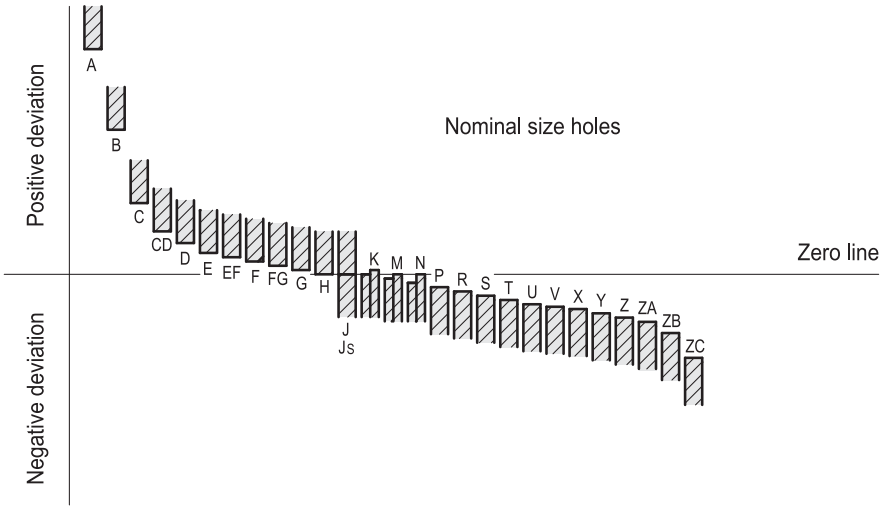
4. Machine tolerance

The reference tolerance system is the: ISO System - Basic hole

TOLERANCES OF THE METAL INSERTS

Plain holes in the bosses and hubs of knobs and handwheels

For the most widely used models, there are various kinds of standardized holes available so the user has a wide selection and is saved the costly task of remachining the hole on assembly. The tolerance of these holes is normally grade H7, but in a few cases it is grade H9. The degree of tolerance is always indicated in the tables of each article, in the hole size column. For cases in which it is more difficult to propose a standardization of the holes that satisfies the broadest range of assembly needs, either a pre-drilled hole with a simple roughing tolerance (hole with a smaller diameter than that of the shaft on which it is expected to be assembled), or a hub with no hole (not drilled) is used.



Holes diameter mm	H7	H9
over 3 to 6	+0.012 0	+0.030 0
over 6 to 10	+0.015 0	+0.036 0
over 10 to 18	+0.018 0	+0.043 0
over 18 to 30	+0.021 0	+0.052 0

• Threaded holes in the bosses and threads of the studs

Machining in accordance with the ISO metric threads for a normal screwing length (see table in chapter 10, page A24).
– Tapped holes of built-in metal bosses = tolerance 6H.
– Metal studs or ends of shanks for revolving handles = tolerance 6g.

TOLERANCES OF HOLES AND THREADS IN THE PLASTIC MATERIAL

• Plain holes (for handles with a through hole for assembly in an idle condition on pins). Despite the considerable difficulties encountered in maintaining the tolerances in a machining process in which numerous factors influence the end result, the size of the diameter of the axial hole is normally respected with a tolerance of C11. The handles may therefore also be assembled on pins made from normal drawn parts. If the pin is obtained by turning from a bar with a greater diameter, a machining process with a tolerance of h11 is recommended, as this gives a suitable free coupling, with the advantage of a quick, simple and inexpensive machining process.
• Inside threads (for handles with no metal bushing to be screwed in and fixed to threaded pins). They are normally kept undersized so that assembly is slightly forced at ambient temperature.
• Outside threads (for filler breather caps or level indicators with a threaded connector). In this case, for reasons related to the process technology and the type of plastic, which may absorb small amounts of moisture from the outside environment, the tolerances must be interpreted taking this into account though the tightening of the component assembled is never actually jeopardized in practice.

5. Fixed handles
(Types of assembly)

Various kinds of couplings are used for securing fixed handles to the shaft:
– handles with brass boss or nutscrew moulded into the plastic material for screwed assembly on a threaded shaft;
– handles with built-in self-locking boss made of special technopolymer (ELESA Original design) for push-fit assembly on a plain shaft (unthreaded) made from a normal drawn rod (ISO tolerance h9). This solution prevents spontaneous unscrewing in time due to the vibrations to which the lever is subjected or the rotary forces exerted inadvertently by the operator's hand while handling the lever itself;
– handles with threaded hole obtained from moulded plastic material.

For executions with threaded holes obtained from moulded plastic material, the measure of keeping the thread undersized with respect to the specifications laid down in the standards has been taken. This enables the threads of the nut screw to adapt slightly to the screw, when tightening at ambient temperature, thus creating a coupling with an elastic reaction that gives an effective locking effect. Even better results may be obtained by hot assembly: the handle is heated to 80÷90 °C before being screwed onto the threaded pin. This method of assembly initially facilitates the screwing operation in that the thread of the nut screw is expanded when screwed in and subsequently enables an extremely efficient locking effect to be obtained from shrinkage on cooling, due to the slight roughness of the surface of the thread on the shaft.

The solution with a self-locking bushing made of special technopolymer (Fig.1) is, in any case the most effective against spontaneous unscrewing in that the elastic coupling is not susceptible to any vibrations or rotary forces exerted by the operator's hand.

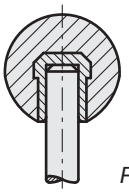


Fig.1

The lock is also such as to ensure that the handle does not come out even when subjected to a normal pulling action along its axis. In relation to this, the results of the research work and tests carried out at the ELESA+GANTER laboratories are provided and they confirm the technical validity of the coupling with self-locking bushings made of special technopolymer (Fig. 2 and 3).

The graph in Fig. 2 shows the variations in axial translation effort expressed in [N] as a function of the variations in diameter of the shaft (mm), dry and degreased with trichloroethylene. The two curves represent the minimum and maximum values in hundreds of tests conducted on a type of self-locking handle with a hole having a O 12 mm. The area A contains the values that refer to shaft with a commercial diameter of 12 mm (tol. h9).

The graph in Fig. 3 shows the variations in axial translation effort (mean values) as a function of the surface area of the shaft. As may well be imagined, the presence of lubricating or emulsifying oil on the surface of the shaft lowers the handle removal effort. It may however be readily noted that, even in this unfavourable condition, the axial effort required to slide the handle out is always such as to ensure that this cannot actually happen in practice.

The use of this kind of handle ensures a considerable saving in that it does not entail machining thread on the end of the shaft. The self-locking bushing made of special technopolymer enables an elastic coupling to be obtained and the handle itself maintains all its surface hardness and wear resistance typical of thermosetting materials.

Assembly instructions: fit the handle onto slight chamfered shaft end and push as far as possible by hand or by means of a small press. Alternatively it is possible to tap the handle with a plastic or wooden mallet until firmly in place. In this case we strongly recommend to use a cloth or other suitable soft material over the product to avoid any surface damage.

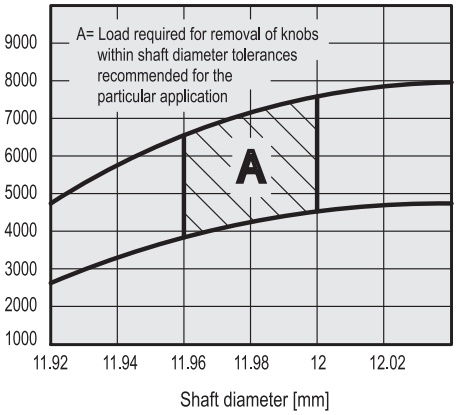

Fig.2

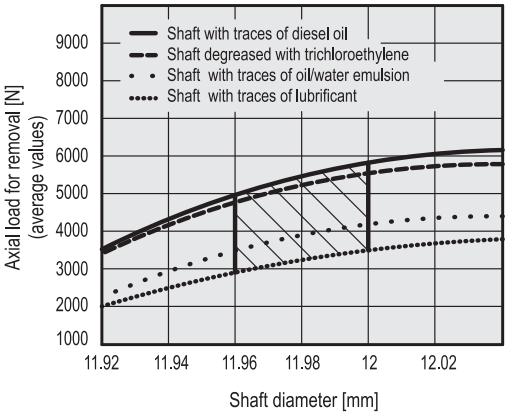

Fig.3

TECHNICAL DATA

6. Assembly measures

Plastic is a poor conductor of heat and has a different thermal expansion coefficient from that of the metal inserts so measures must be taken, while remachining the hole, to stop the hubs and bosses from overheating: in fact, the heat produced is not dissipated and the metal parts expand and create stress inside the body of the plastic which has a damaging effect on the strength of the assembly (Duroplasts).
In addition, for thermoplastics (Technopolymers), temperatures close to their softening point could be reached with the risk of the metal insert coming loose.
It is therefore always necessary to adopt cutting and feed rates that do not produce marked localized heating and to cool intensively when the holes have a large diameter and depth with respect to the size of the bushing.
To conserve maximum gloss of the surfaces, we recommend, once machining has been completed, to avoid leaving the plastic wet for a long time, by removing all residual emulsified water from the surfaces; use oil only, if possible.
The machining processes commonly required for the assembly of handwheels or knobs are:

– **remachining of axial hole in the bosses (blind hole)**
When remachining the hole of a built-in metal boss, always avoid operating as shown in Fig.4, because both during the drilling operation and during the insertion of the small shaft, an area of the plastic covering may be subjected to stress, with the risk of cracking or detaching the part indicated with cross shading. The operation shown in Fig. 5 is the most rational.

Note that in the ELESA+GANTER parts, remachining of the axial hole may be performed under the correct conditions indicated above in that the length of the built-in bosses is always indicated in the table of each article so, for the depth of the hole, reference should simply be made to the basic plan.

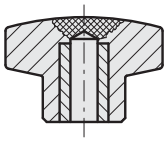

Fig.4

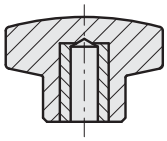

Fig.5

– **remachining of the axial hole in the bosses (case of a pass-through hole)** If the drilling operation affects not only the metal boss but also a layer of the covering material, the handwheel must be centred carefully and drilling should be started from the plastic side otherwise, chipping may occur when the tool is removed.
– **transversal threading in the boss for grub-screw** To be performed in accordance with the instructions given above. Avoid threading both the metal and the plastic: it is better to drill the hole in the plastic part and thread the metal part only.

Drilling or threading operations to be performed entirely in the plastic are exceptional. Bear in mind that the difficulty with which the heat produced locally is dissipated, also through the abrasive action of the plastic on the tool, worsens considerably the latter's working conditions, resulting in a rapid wear of the cutting edges (use hard metal tools).

7. Special executions

The range of ELESA+GANTER elements is extremely broad and offers designers valid alternatives as regards designs, properties and performance of materials, sizes..., to satisfy the most different applicational needs. The customer may however need to ask for changes to the standard part or have it made in different colours to adapt it to particular applications. In these cases, ELESA+GANTER engineers are at the customer's full disposal to satisfy these requests for special executions which must be required in sufficient quantities for the modifications they may entail to the moulds.

8. Colours

In addition to black, which represents the most commonly used colour for plastic components, a large number of standard elements are available in the following colours:

Colours in RAL					
	7021		3000		7030
	2004		6001		7040
	7035		9006		7042
	1021		9005		3002
	5024		7031		9002

As the RAL tables refer to the colour of paints and are therefore colours with a glossy surface, the RAL code is indicated indicatively because the tone of the colour of the moulded part may differ slightly, depending on various factors such as the colouring of the polymer pigments (polyamide or polypropylene), the glossy or matte finish, the thickness and the shape of the product.

9. Test values

All the information about the test values are based on our experience and on laboratory tests conducted under specific standard conditions and in a necessarily limited time.
Any indicated value must therefore be taken only as a reference for the designer who will apply adequate safety coefficients to them according to the product application. The designer and the purchaser are responsible for checking the suitability of our products for their final use under the actual operating conditions.

10. Technical tables

The units contained in the present catalogue, are those of the International System (S). Conveniently, here under there is a list of the parameters converted into the units currently used or into the British ones.

Information

The connection between the operating element and the shaft consists very often of a cross pin or a grub screw.

As a result the user is faced with relatively high costs since cross holes on operating elements are in general not readily available.

Components with cross holes to GN 110 are not only offered at very competitive prices but they also save the manufacturer unnecessary drawing work. The geometrical form of some of the operating elements, however, does not lend itself to modification to this particular GN standard.

The pin hole d2 H11 is drilled to suit drive spring pins.

Information

Cross holes in universal joint shafts and in universal shafts are ideal for the production of shaft-hub links using a pin or a thrust screw. For bore holes with a feather key groove or square, they serve to secure the axial position of universal joint and shaft.

The d2 pin bore with H11 tolerance is intended for use with coiled spring pins.

The position of the cross holes / the threaded hole with reference to the hub key slot / the square or of the universal joints is shown in the overview.

Should one of the joint sides be delivered without **transversal holes** / **threaded holes**, this is indicated with **QX** on the desired location of the article number.

10.7 DIN EN ISO 898-1 | DIN EN 20898-2 Strength values

Strength values of bolts/nuts EN ISO 898-1 EN 20 898-2

	Strength classes of bolts						
Nominal tensile strength Rm, Nenn N/mm²	4.6	5.6	5.8	6.8	8.8	10.9	12.9
Lower yield point ReL N/mm²	400	500	500	600	800	1000	1200
0.2 % yield limit Rp 0.2 N/mm²	240	300	400	480	–	–	–
Tension under test force Sp N/mm²	225	280	380	440	580	830	970
Elongation A %	22	20	–	–	12	9	8

The strength class identification consists of two numerals:
– the first number corresponds to 1/100 of the nominal tensile strength in N/mm² (see table)
– the second number shows ten times the ratio of lower yield point ReL (or 0.2 % yield limit Rp 0.2) and nominal tensile strength Rm, nom (yield point radio).
Example; Strength class 5.8 means
Minimum tensile strength Rm = 500 N/mm²
Minimum yield point ReL = 400 N/mm²

Strength classes of nuts

Nominal tension Sp N/mm² for thread	5	6	8	10	12
Below M 4	250	600	800	1040	1150
Above M 4 below M 7	580	670	855	1040	1150
Above M 7 below M 10	590	680	870	1040	1160
Above M 10 below M 16	610	700	880	1050	1190
Above M 16 below M 39	630	720	920	1060	1200

The designation of a strength class consists of a distinctive number which provides information of the test tension of the material used:
– distinctive number x 100 = test tension Sp
– the test tension is equal to the minimum tensile strength in N/mm² of a bolt which, if paired with the appropriate nut, can be loaded up to the minimum yield of the bolt.
Example: Bolt 8.8 – nut 8, connection can be loaded up to the minimum yield point of the bolt.

10.8 DIN ISO 286 ISO-Fundamental tolerances

This ISO Standard represents the basic for a system of nominal dimensions and sizes whereby the table mirrors the calculated values of basic tolerances relating to basic dimensions.
The use of this table is limited to smooth circular cylindrical workpieces or such with two parallel fitting planes or contact areas.
The values attributed to an ISO tolerance grade (IT) specify the tolerance value and hence the tolerance area. With ascending numbers, the size of the tolerance increases.
For identification purpose of the position of the tolerance area in relation to the nominal dimension (zero), the number chosen as tolerance grade IT is preceeded by a letter.
Tolerance area H is the most common value for bores. It specifies that the minimum dimension of the bore corresponds to the nominal dimension.
The permissible maximum dimension corresponds to the nominal dimension plus the IT tolerance.

Examples:
bore 20 H7 = 20 + 0.021/0
min. dimension: 20.000
max. dimension: 20.021

bore 8 H11 = 8 + 0.090/0
min. dimension: 8.000
max. dimension: 8.090

10.9 IP Protection Classification

IP Protection Classification for Cases according to international Standard EN 60529			
1st digit Protection against intrusion of solid foreign bodies.		2nd digit Protection against pentration of liquids.	
0	No protection.	0	No protection.
1 	Protection against intrusion of solid foreign bodies, Ø larger than 50 mm (hands).	1 	Protectionagainst drops of condensed water falling vertically.
2 	Protection against intrusion of solid foreign bodies, Ø larger than 12 mm (fingers).	2 	Protection against drops of liquid falling at an angle equal to or smaller than 15° with respect to the vertical.
3 	Protection against intrusion of solid foreign bodies, Ø larger than 2.5 mm (tools, wires).	3 	Protection against drops of liquid falling at an angle euqal to or smaller than 60° with respect to the vertical.
4 	Protection against intrusion of solid foreign bodies, Ø larger than 1 mm (wires).	4 	Protection against liquid splashed from any direction.
5 	Protection against harmful deposits of dust, which damage the correct operation.	5 	Protection against water jets projected by a nozzle from any direction.
6 	Complete protection against instrusion of durst.	6 	Protection against water from heavy sea on ship's decks.
As a specification for cases of rotary controls does not exist, we refer to International Standard EN 60529 for protection classification of cases for electrical machines, devices of materials.		7 	Protection against immersion in water under stated condi-tions of pressure and time.
		8 	Protection against indefinite immersion in water under stated conditions of pressure.

The torque values are based on a test of a thread without preload with a nut thread 6H at room temperature. For PFB and thread lenghts $l_0 < l_2$, l_2 is reduced in such a way that one to two thread turns are not coated at the end of the thread.

Description

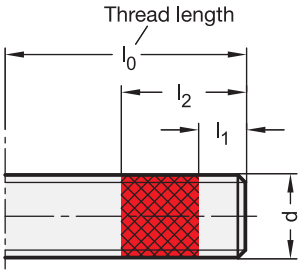
The polyamide patch coating PFB is a process whereby an elastic plastic material (Polyamide) is applied to a part of thread which creates a jamming action during the tightening of a nut. The coating can be produced either as a patch or complete coating. The axial play between the bolts and nut thread is taken up by the polyamide thus ensuring maximum surface pressure between the opposite uncoated thread flanks. This process counteracts the loosening and unscrewing on their own. There is no cure time required, the thread contact is instantaneous resilient. The typical spray edge zone of the polyamide deposit prevents shear blasting.

Features

– High thread locking action, shakeproof. Excellent convenient for adjusting bolts.
– The locking system is a captive component of the standard part, which eliminates the fitting of additional belay.
– Temperature resistant from – 60 °C up to 120 °C
– Approval for food areas
– High chemical stability
– Use is also possible, for instance, in oil-contaminated threaded holes
– Multi use is possible whereby the jamming effect after the 5th removal is around 50 % of its original strength.

Information
Polyamide patch coating is offered for GN 615.3 (see page 840) spring plungers. A blue coating indicates type K or KN, green indicates type KS or KSN (high spring load). Polyamide complete coating is available for GN 252 and GN 252.5 blanking plugs (see page 1685) as a type.

MVK Thread locking gluing Micro encapsulation precote 80 (red)



$l_1 \approx$ 2 to 3 x Thread pitch
$l_2 \approx$ 1.5 x d

d	l_1	$l_2 \approx$	**Min** in Nm max. insertion torque	**Mlb** in Nm min. breakaway torque	**Mout** in Nm max. loosening torque

M 12	3.5 ... 5	18	5	16	95
M 16	4 ... 6	24	11	35	250
M 20	5 ... 7.5	30	14	45	500

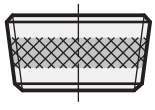
The torque value comply with DIN 267 Part 27. They are based on a test of a thread without preload with a nut thread of 6H at room temperature. For thread lengths $l_0 < l_2$, l_2 is reduced in such a way that one to two thread turns are not coated at the end of the thread.

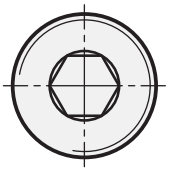
Description
The principle of micro encapsulation MVK (gluing) consists of a liquid plastic material and hardener encapsulated in a thin polymer film which is embedded in a lacquer like carrier deposited in patch form an a thread. This patch dries and the component can be stored and handled in a normal manner.
When fitting a bolt with this patch the two capsules will burst under the pressure and friction between the two threads. The liquid plastic material and hardener will mix leading to a chemical reaction which will harden the glue, thus giving the required thread locking.
The setting of the mixture will start after 10 – 15 minutes. Sufficient hardness is achieved after about 30 minutes but complete setting is reached after 24 hours.
Adjustment and setting process must be completed within about 5 minutes.
The thread locking can be cracked by applying the Mout torque on the thread or alternatively by heating the component over +170 °C. It is not recommended to re-use the thread.
Threads, free from oil and grease give increased strength of locking action.
Components treated with this process can be stored for up to 4 years.

Features
– Thread locking to the highest order to prevent the self loosening and component loss even under vibration. Not suitable for adjustable bolts or screws.
– This security aspect may be essential for certain applications of standard parts. Stockholding of liquid glue is eliminated.
– Low insertion torque
– Temperature resistant from – 40 °C up to 170 °C
– Excellent chemical stability

GPC Tightening with thread coating Precote 5 (white)

Threaded plugs DIN 906





Description
Precote 5 is a non-reactive, film-forming emulsion with mineral solids for coating threaded parts.
The coating generates a seal against gases and liquids in threaded parts, both in cylindrical / cylindrical and in cylindrical / conical pairs. Corrosion in the threaded connection is prevented.
The coating is solvent-free, dry and non-sticky. It is non-hazardous for health.
The minimum storage stability in unmounted state is 4 years.

Features
– The sealing coat is a captive element of the locking screw. It saves storing and mounting locking materials.
– The sealing effect sets in after mounting, no curing time is required.
– The friction rating of the thread remains virtually constant, the working-loose torque is low, max. reusable once.
– Sealing effect of thread: cylindrical / cylindrical < 15 bar cylindrical / conical > 50 bar
– Temperature resistance: from – 50 °C to 180 °C
– Good chemical resistance, e.g. against oils, water, petrol and solvents

10.12 Surface treatments
in alphabetical order

Anodizing
Anodizing is one of the most widely used methods for treating the surface of aluminum workpieces. In this surface treatment, an anodizing process is used in which the surface of the component is specifically oxidized electrolytically – the top layer converts into a stable oxide compound Al_2O_3. Changing the process parameters allows the layer thickness to be varied between 5 and 25 µm and allows organic, inorganic, or electrolytic coloration.
The surface treatment takes place in an electrolytic tank, whereby the workpiece acts as the anode and the sulfur or oxalic acid filing is the cathode. Usually direct current is used, which creates a weak flow of current between the two electrodes. The hydrogen ions created in this process stimulate electrochemical corrosion on the aluminum surface, during which released atomic oxygen reacts with the metallic aluminum to form a hard oxide layer.
Anodizing is mainly used to give aluminum workpieces better corrosion resistance. Introduction of dyes in the Al_2O_3 layer also allows anodizing to permanently color code components or visually enhance them – for example, by means of a red color.

Black oxide coating
Black-bronzed parts are only minimally protected against corrosion. The process is therefore, usually used to improve storage stability or for decorative reasons.
When the workpieces are placed in the hot black oxide solution, a chemical reaction creates a mixed oxide layer consisting of FeO and Fe_2O_3 with a maximum thickness of 1.5 µm. The dimensional accuracy is preserved. The conversion layer is heat resistant up to about 300 °C and is resistant to abrasion and bending, although it is too porous to provide adequate protection against corrosion. This protection can be achieved through additional coatings for which the black-oxide layeracts as a primer. The process is standardized according to DIN 50938.

Chrome-plating
Chromium layers with thicknesses between 8 and 10 µm are used for decorative purposes and are available as glossy or matte chrome-plating from ELESA+GANTER. The process is a galvanic process. Chromium ions are supplied from an aqueous solution with a chromic acid base.
Usually a combination of layers are necessary, whereby which the chromium always forms the top layer. For example, ELESA+GANTER uses two-layer chrome-plating with nickel as the first layer and chromium as the top layer. The three-layer process is also used. Here the first layer is copper, the second nickel, and the final layer is chromium.
Chrome-plating is a comparably cost-intensive process that places high demands on occupational safety and environ-mental protection due to the use of chromium(VI)-based electrolytes. Alternative electrolytes based on non-toxic chromium(III) are still in the testing phase.

Electropolishing
This electrochemical process reduces surface roughness and removes impurities, microfissures, and microstructural defects in stainless steel parts. The workpiece is placed into an immersion bath containing material-specific electrolytes and forms the anode from which a thin metallic layer is removed after direct current is applied.
Electropolishing operates on the micro-scale and removes rough peaks, while generating increased abrasion at the edges, which also makes electropolishing ideal for fine deburring. The process is gentle on the structure since there is neither thermal nor mechanical stress.In addition to decorative applications, electropolished elements are used, for example, in the chemistry and food industry, in container construction, or in medical technology.

Galvanizing
This general term stands for various processes for the application of pure zinc layers to steel. In all cases, the objective is to protect the substrate against corrosion for as long as possible. The galvanic zinc-coating most commonly used by ELESA+GANTER uses a bath in which an electrolyte connects the workpiece which acts as the cathode to an anode made of pure zinc.
Depending on process parameters, the layer thicknesses which are deposited in this way range from 2.5 to a maximumof 25 µm. The process, which is standardized according to DIN 50979, is mainly suitable for corrosion protection of small parts.
The zinc which is present on the surface may also be exposed to corrosion depending on ambient conditions and is therefore subsequently protected by additional passivation to prevent zinc corrosion (white rust). In addition, treatment with suitable chromium(VI)-free solutions creates a chromate layer, which considerably improves the corrosion resistance of the zinc coating. Dyes can also be introduced in this process step.

Surface treatments continued

Nano-passivation
This process provides exceptionally good corrosion protection with minimal layer thicknesses for die-cast zinc parts. The passivation layer is only 0.3 to 0.5 µm thick and does not affect dimensional accuracy. ELESA+GANTER, usually uses an anthracite-colored layer.
The passivation consists of a chromium(III) layer and an overlying layer consisting of nanoscale SiO_2 particles which have self-healing properties. If the surface becomes damaged down to the metallic substrate, the SiO_2 particles migrate through the potential differences in a mobilized way to the unprotected area to reclose the layer.
Nano-passivation can be performed quickly and economi-cally as a spray or immersion process – and is also a good primer for subsequent, further coatings, such as powder coating.

Nickel-plating
This term is a collective term for different processes that are used to apply nickel to metallic substrates. Nickel-plating is divided mainly into galvanic and chemical nickel-plating.
With galvanic nickel-plating according to DIN EN ISO 1456, nickel ions are deposited from an electrolyte by the application of an electrical voltage. The layer created in this way appears silvery with a light yellow shade and is resistant to water and diluted acids and bases, but does not protect against tarnishing. Corrosion protection is also only provided to a limited extent, as the layers, which are less than 25 µm thick, are usually porous and are therefore susceptible to pitting. Multi-layer systems with chromium as the top layer are more resistant in this respect.
Chemical nickel-plating, on the other hand, is not an electrochemical process. It is a reduction reaction of the surface of the part in the electrolyte bath, in which a uniform, non-porous nickel layer is formed. The end result provides very good protection against corrosive media, good abrasion resistance, and high hardness – including for parts with complex geometries with interior surfaces. The nickel layer created in this way can be soldered and is non-ferromagnetic.

Powder coating
Powder coating, also known as plastic coating, usually refers to the electrostatic process variant. The powder, consisting of pigmented thermoplastic polymer or reactive binding agents made of epoxy resin, polyester resin, or acrylic resin, is applied to the workpiece.
Inside the spray nozzle, the powder accumulates a negative electrostatic charge, flows along the field lines to the grounded workpiece, and also reaches the rear of the workpiece. The electrostatic charge reduces overspray and ensures adhesion of the powder up to its thermal fusion.
The actual closed and homogeneous layer, with a thickness in the range from 100 to 200 µm, is not created until this step in the process. Depending on powder type, the layers are highly resilient, weather-proof, and corrosion-resistant. They also can be produced in a wide variety of colors. Powder coating is very popular due to the ease of automation of the process and its economic feasibility.

Steam oxide coating
This process is used for the post-treatment of hardened sintered parts for which black oxide coating using a saline solution cannot be used.
With steam oxidation, the sintered part is treated with water vapor at temperatures in excess of 350 °C. The result is a thin, almost black homogeneous oxide layer of about 1 µm. Steam oxide coating only increases corrosion resistance to a small extent.

10.14 Duroplast, elastomer, technopolymer and rubber characteristics

Elastomer (Rubber)						
International symbol	**NR**	**NBR**	**CR**	**FKM - FPM**	**TPE**	**PUR**
Brand name (es.)		Perbunan®	Neoprene®	Viton®	SANTOPRENE®	Bayflex®
Chemical name	Polisoprene	Acrylonitrile-butadiene Rubber	Chloroprene Rubber	Fluorine Rubber	Thermoplastic Rubber	Polyurethane
Hardness (shore A)	from 30 to 95	from 25 to 95	from 30 to 90	from 65 to 90	from 55 to 87	from 65 to 90
Temperature resistance						
Short-term	from -55° to +100 °C	from -40° to +150 °C	from -30° to +150 °C	from -30° to +280 °C	from -40° to +150 °C	from -40° to +130 °C
Long-term	from -50° to +80 °C	from -30° to +120 °C	from -20° to +120 °C	from -20° to +230 °C	from -30° to +125 °C	from -25° to +100 °C
Tensile strength [N/mm^2]	27	25	25	20	8.5	20
Wear / Abrasion resistance	excellent	good	good	good	good	excellent
Resistance to						
Oil, grease	not suitable	outstanding	good	good	good	very good
Solvents	low	good in part	good in part	very good	outstanding	satisfactory
Acids	low	restricted	good	very good	outstanding	not suitable
Caustic solutions	low	good	very good	very good	outstanding	not suitable
Fuels	not suitable	good	slight	outstanding	good	good
General		NBR Synthetic rubber resistance to swelling when in contact with oils and fuels. Standard material for O-rings.	CR Synthetic rubber excellent resistance to ageing, atmospheric and environmental influences.	FPM Resistance to contact with fuels, oils, solvents, acids, caustic solutions and to atmospheric and environmental influences. High price, to be used for applications under severe conditions.	SANTOPRENE® Thermoplastic rubber, its performances are comparable to those of many customary vulcanised special rubbers. Outstanding dynamic fatigue life, excellent resistance to ozone and to atmospheric and environmental influences.	PUR Excellent mechanical characteristics, resistance to atmospheric and environmental influences. Extreme resistance to wear and tear.

Perbunan® and Bayflex® are registered trade-marks by Bayer.
Viton® is registered trade-mark by DuPont Dow Elastomer.
Neoprene® is registered trade-mark by DuPont SBR.
SANTOPRENE® is registered trade-mark by Advanced Elastomer Systems.

The characteristics described should be treated as guidelines only. No guarantee is made.
The exact conditions of use have to be taken into account individually.

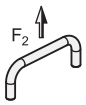
10.15 Load ratings U-Handles

Load capacity F1 in N



Load capacity F2 in N

Load rating of cabinet U-Handles / Tubular handles in metal in ascending order of the standard numbers

An extensive series of tests were carried out with the cabinet "U" handles / Tubular handles listed below.

The handles were slowly loaded and relieved at room temperature with incrementally increasing force. After load relieve, a deTypeation irrelevant in terms of function and appearance remained at the listed values for F1 and F2 respectively. The breaking loads were in most cases multiples above the specified value.

Note:
The details given on load rating are non-binding guide values without any liability. In general, they do not constitute a warranty of quality.

The user must determine from case to case if a product is suitable for the envisaged use. Ambient factors and ageing may influence the specified values.

10.16 Load ratings metal hinges

Load rating of metal hinges in ascending order of the standard numbers

An extensive series of tests were carried out with the hinges listed below.

The hinges were slowly loaded and relieved at room temperature with incrementally increasing force. After load relieve, a deformation irrelevant in terms of function and appearance remained at the listed values for L_A, L_{R0} and L_{R90}. The breaking loads were in most cases multiples above the specified value.

The details given on load rating are non-binding guide values without any liability. In general, they do not constitute a warranty of quality.

The user must determine from case to case if a product is suitable for the envisaged use. Ambient factors and ageing may influence the specified values.

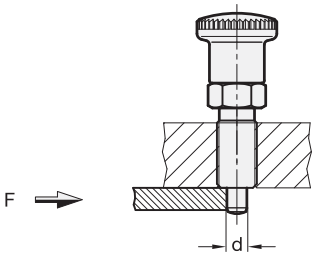
10.17 Strength of indexing plungers



Computing the strenght of indexing plungers for shear loads / flexure loads of the plunger pin

Shear loads

Provided that a miniscule gap remains between the guide of the indexing plunger and the indexing bore hole opposite, the load can be reduced to a clean shear action. As this is normally not the case, the "flexure" load case should preferably be considered on the following page. Approximately 80 % of the bolt's tensile strength is assumed for the shear strength. This approach calculates against the tensile strength R_m, i.e. against the indexing pin shearing off. Any pre-existing and remaining deformation may, however, mean that the indexing plunger can be used no longer.
To ensure the permanent and proper function of the indexing plunger, the yield limit R_e must be considered in place of the tensile strength R_m.

Formulas for computation

Bolt cross-section	Limit tension	Shear force
$S = \frac{d^2 \times \pi}{4}$	$\tau_a = 0.8 \times R_m$	$F = S \times \tau_a = \frac{d^2 \times \pi}{4} \times 0.8 \times R_m$

Material characteristics

The tensile strength shown in the table below (R_m) and the yield or substitute yield limit (R_e / $R_{p\ 0.2}$) have been determine in tension tests involving tension specimen in accordance with DIN 50125-B6-30. These tests constitute the basis for the load bearing details given herein.

Material Description	Material no.	**R_e** in N/mm²	**R_m** in N/mm²
C45Pb	1.0504	560	640
X 10 CrNiS 18 9	AISI 303	580	740

Computing examples, load values

Example:
Indexing plungers with a bolt diameter of 6 mm made of Stainless Steel with a yield limit of R_e = 580 N/mm², computation against permanent deformation, the maximum permissible shear stress is wanted.

$$F_{per} = \frac{(6\ mm)^2 \times \pi}{4} \times 0.8 \times 580\ N/mm^2 = 13120\ N$$

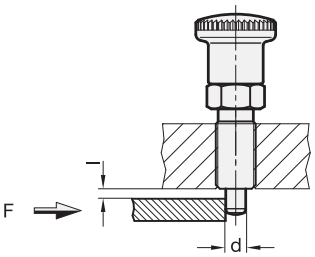
d Bolt diameter	max. force **F** in N, acc. to material and strength value differs			
	C45Pb / 1.0504		X 10 CrNiS 18 9 / 1.4305	
	at R_e	at R_m	at R_e	at R_m
3	3160	3610	3270	4180
4	5620	6430	5830	7430
5	8790	10050	9110	11620
6	12660	14470	13120	16730
8	22510	25730	23320	29750
10	35180	40210	36440	46490
12	50660	57900	52470	66950

Safety informaion

On principle, the design also needs an adequate safety coefficient to be taken into account. The usual safety coefficients under static load 1.2 to 1.5; pulsating 1.8 to 2.4 and alternating 3 to 4.

Disclaimer:

All products are standard elements for versatile uses and as such are subject to extensive standard tests. You should carry out your own test series to verify whether a certain product is suitable for your specific applications. We cannot be held responsible for this.



Flexure loads
As soon as a gap l remains between the guide and the indexing bore hole opposite, the load can be reduced to a flexure rod clamped in at one side.
With this approach, the computation is made against the bending of the indexing plunger as a case of failure.

Formulas for computation

Resistance torque	Flexural stress	Flexural strength
$W = \frac{\pi \times d^3}{32}$	$M_b = \sigma_b \times W$	$F = \frac{M_b}{l} = \frac{\sigma_b \times \pi \times d^3}{l \times 32}$

Material characteristics
The yield or substitute yield limit (R_e / $R_{p\ 0.2}$) shown in the table below has been determine in tension tests involving tension specimen in accordance with DIN 50125-B6-30. These tests constitute the basis for the load bearing details given herein.

Material Description	Material no.	**R_e** in N/mm² (≈ per. flexural tension σ_b)
C45Pb	1.0504	560
X 10 CrNiS 18 9	AISI 303	580

Computing examples, load values

Example:
Indexing plungers with a bolt diameter of 5 mm made of steel with a yield limit of R_e = 560 N/mm², computation against permanent deformation, the maximum permissible flexural strength is wanted:

$$F_{per} = \frac{560\ N/mm^2 \times \pi \times (5\ mm)^3}{2\ mm \times 32} = 3430\ N$$

d Bolt diameter	max. flexural strength **F** in N, acc. to material and gap **l** differentiated			
	C45Pb / 1.0504		X 10 CrNiS 18 9 / 1.4305	
	l = 2 mm	**l** = 3 mm	**l** = 2 mm	**l** = 3 mm
3	740	490	760	510
4	1750	1170	1820	1210
5	3430	2290	3550	2370
6	5930	3950	6140	4100
8	14070	9380	14570	9710
10	27480	18320	28470	18980
12	47490	31660	49190	32790

Safety information
On principle, the design also needs an adequate safety coefficient to be taken into account. The usual safety coefficients under static load 1.2 to 1.5; pulsating 1.8 to 2.4 and alternating 3 to 4.

Disclaimer:
Our information and recommendations are given with non-binding effect and ruling out any liability, unless we have expressly committed ourselves in writing to provide information and recommendations. TECHNICAL DATA

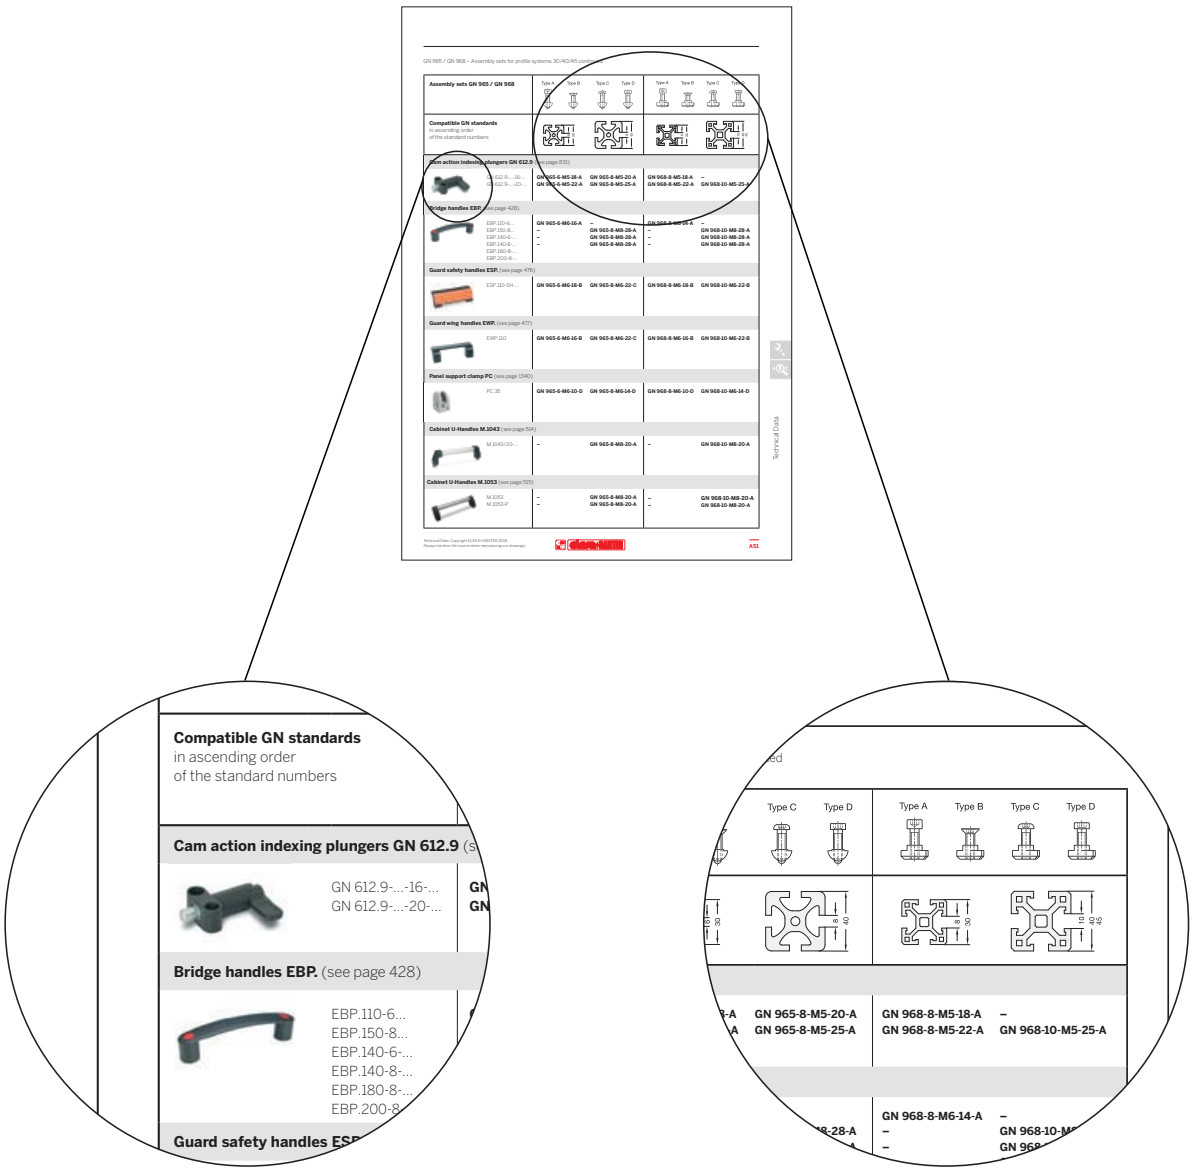
10.18 Assembly sets GN 965 and GN 968

Selection of the appropriate assembly sets

ELESA+GANTER offers many products which are compatible with the most common T-Slot Profile Systems.
Show the tables to select the assembly set you need.



1. Your ELESA+GANTER product
The left hand column of the table shows the compatible ELESA+GANTER products, sorted in ascending standard number. At this point, first select the standard part to be mounted.

2. Your assembly set
The columns on the right hand side show assembly sets matching the selected products.
Depending on the profile shape, select the standard GN 965 or GN 968. The list underneath the profile cross-sections show the order numbers for the matching sets.

Assembly sets GN 965 / GN 968	Type A	Type B	Type C	Type D	Type A	Type B	Type C	Type D

11 Vibration-damping elements - Guidelines for the choosing

Basic data required

- Disturbing frequency: the frequency of the disturbing vibration produced by an on-duty machine. In general, it is obtained by the number of rotations of the engine [Hz=r.p.m./60];
- The load applied to every single vibration-damping element [N];
- The isolation degree required [%];
- The deflection value of the vibration-damping element under a given load [mm];
- The stiffness [N/mm], that is to say the load that applied to the vibration-damping element produces a deflection of 1.0 mm.

How to choose the vibration-damping element

- With reference to the diagram for checking the isolation degree, intersect the disturbing frequency value with the isolation degree required (each isolation degree corresponds to a line in the diagram) and define the deflection [in mm];
- Divide the load applied onto the vibration-damping element by the deflection value to obtain the required stiffness of the vibration-damping element;
- Compare the stiffness obtained with the stiffness shown in the table and choose the vibration-damping element which presents the nearest value (lower) to the calculated one (the stiffness values reported in the table refer to the maximum load values);
- The designer must verify that the article chosen through this selection criterion is suitable for the application required, in any case. For this purpose on request for each article, non-linear graphs of the spread (according to the applied load) are available.

Example

Conditions of use:

- Disturbing frequency= 50 Hz (3,000 r.p.m.);
- Load applied on each vibration-damping element 120 N;
- 90% isolation required;
- Diagram shows that with a 50 Hz disturbing frequency and an isolation degree of 90%, the deflection obtained is 1.0 mm;
- Divide the load applied by the deflection obtained to define the rigidity required, which is 120/1.0 = 120 N/mm;
- Compare the rigidity value obtained (120 N/mm) with the values reported in the table;
- The values reported in table, for type DVA.1, show that the vibration-damping element which should be used is DVA.1-25-20-M6-18-55.

Diagram for checking the isolation degree of the vibration-damping element
